

# DIRECT FASTENING TECHNOLOGY MANUAL 11/2022

# **Contents**

| Part 1: Direct fastening principles and technique    | 13 |
|--|----|
| 1. Introduction                                      | 13 |
| 1.1 Definitions and general terminology              | 13 |
| 1.2 Reasons for using direct fastening               | 13 |
| 1.3 Direct fastening applications                    | 15 |
| 2. The direct fastening system                       | 16 |
| 2.1 Fasteners  | 17 |
| 2.2 Manufacturing process                            | 18 |
| 2.3 Fastener raw material                            | 19 |
| 2.4 Types of Hilti direct fastening tools            | 20 |
| 2.5 Operating principles                             | 22 |
| 3. Health and safety                                 | 25 |
| 3.1 Operator safety                                  | 25 |
| 3.2 Fastening safety                                 | 30 |
| 3.3 Quality of installation                          | 31 |
| 4. Corrosion   | 33 |
| 4.1 Corrosion protection of direct fastening systems | 33 |
| 4.2 Fastener selection                               | 35 |
| 5. Steel base material                               | 39 |
| 5.1 Anchoring mechanisms                             | 39 |
| 5.2 Factors influencing pull-out resistance          | 41 |
| 5.3 Suitability of the steel for fastening           | 46 |
| 5.4 Application limit diagrams                       | 47 |
| 5.5 Thin steel base material                         | 48 |
| 5.6 Types of load and modes of failure               | 49 |
| 5.7 Effect of fasteners on structural steel          | 56 |
| 6. Concrete base material                            | 61 |
| 6.1 Anchoring mechanisms                             | 61 |
| 6.2 Factors influencing resistance to pull-out       | 63 |
| 6.3 Effect of time on pull-out resistance            | 66 |
| 6.4 Effect on concrete components                    | 67 |
| 7. Masonry base material                             | 68 |
| 7.1 General suitability                              | 68 |

|   | 8. Temperature e      | ffects on the fastening   | 69  |  |  |
|---|-----------------------|---|-----|--|--|
|   | 8.1 Effect of low to  | emperatures on fasteners  | 69  |  |  |
| 8.2 Effect of low temperatures on fastenings to steel |                       |   |     |  |  |
|   | 8.3 Fire rating of fa | astenings to steel  | 72  |  |  |
|   | 8.4 Fire rating of fa | astenings to concrete   | 74  |  |  |
|   | 9. Design concep      | ots   | 76  |  |  |
|   | 10. Determinatio      | n of technical data for fastening design                            | 78  |  |  |
|   | 10.1 Fastenings to    | steel   | 78  |  |  |
|   | 10.2 Profile sheet    | fastenings  | 79  |  |  |
|   | 10.3 Fastenings to    | concrete (standard DX / GX / BX)                                    | 80  |  |  |
|   | 10.4 DX fastening     | s to concrete (DX-Kwik)   | 82  |  |  |
|   | 10.5 Fastener des     | ign in the USA and Canada   | 83  |  |  |
|   |                       |   |     |  |  |
|   | Part 2: Fastener      |   | 85  |  |  |
|   | 1. Selecting the r    | •   | 86  |  |  |
|   |                       | ed on the type of concrete  | 87  |  |  |
|   |                       | ed on environmental conditions                                      | 94  |  |  |
|   | 2. Design concep      |   | 96  |  |  |
|   | 3. Nomenclature       | /symbols  | 97  |  |  |
|   | 4. Tips for users     |   | 99  |  |  |
|   | 5. Nail and stud of   | lesignation   | 105 |  |  |
|   | Part 3: Accessor      | ies and consumables compatibility                                   | 111 |  |  |
|   | Powder-actuated       | d tools   | 111 |  |  |
|   | DX 2                  | Semi-automatic powder-actuated tool for fastening single nails      | 113 |  |  |
|   | DX 351                | Powder-actuated tool for interior finishing applications            | 114 |  |  |
|   | DX 351 F8             | Powder-actuated tool for interior finishing, mechanical and         |     |  |  |
|   |                       | electrical applications   | 114 |  |  |
|   | DX 351 BT             | Powder-actuated tool for fastening X-BT threaded studs              | 115 |  |  |
|   | DX 351 BTG            | Powder-actuated tool for fastening gratings                         | 115 |  |  |
|   | DX 351-CT             | Fully automatic powder-actuated tool for fastening ceiling          |     |  |  |
|   |                       | fasteners to concrete or steel                                      | 115 |  |  |
|   | DX 450                | Powder-actuated tool – standard                                     | 116 |  |  |
|   | DX 450-FA             | Powder-actuated tool – facade                                       | 116 |  |  |
|   | DX 460-MX             | Powder-actuated tool for fastening collated nails                   | 117 |  |  |
|   | DX 460-F8             | Powder-actuated tool for fastening single nails                     | 117 |  |  |
|   | DX 460-SM             | Powder-actuated tool for fastening metal decks                      | 120 |  |  |
|   | DX 5 MX               | Digitally enabled powder-actuated tool for fastening collated nails | 121 |  |  |

| DX 5 F8          | Digitally enabled powder-actuated tool for fastening single nails  | 121 |
|------------------|--|-----|
| DX 5 IE          | Powder-actuated tool for fastening insulation  | 124 |
| DX 5 GR          | Powder-actuated tool for fastening gratings  | 124 |
| DX 5 SM          | Powder-actuated tool for fastening metal decks   | 124 |
| DX 5 F10         | Powder-actuated tool for fastening W10 threaded studs  | 124 |
| DX 6 MX          | Digitally enabled powder-actuated tool for fastening collated nails  | 125 |
| DX6 F8           | Digitally enabled powder-actuated tool for fastening single nails  | 126 |
| DX6 IE           | Digitally enabled powder-actuated tool for fastening insulation  | 129 |
| DX6 GR           | Digitally enabled powder-actuated tool for fastening grating   | 129 |
| DX6 F10          | Digitally enabled powder-actuated tool   | 129 |
| DX76 PTR         | Powder-actuated tool for fastening metal decks with collated nails   | 130 |
| DX76 PTR         | Powder-actuated tool for fastening metal decks with single nails   | 130 |
| DX76 PTR         | Powder-actuated tool for fastening metal decks on concrete – DX-Kwik   | 131 |
| DX 76 PTR        | Powder-actuated tool for fastening HVB shear connectors  | 131 |
| DX76 PTR         | Powder-actuated tool for fastening gratings and checker plates   | 132 |
| DX76 PTR         | Powder-actuated tool for fastening gratings and checker plates  Powder-actuated tool for fastening heavy duty applications | 132 |
| DX 76 MX         | Powder-actuated tool for fastening metal decks with collated nails   | 133 |
| DX 76            | Powder-actuated tool for fastening metal decks with single nails   | 133 |
| DX 76            | Powder-actuated tool for fastening metal decks on concrete –   | 100 |
| 27(10            | DX-Kwik  | 134 |
| DX 76            | Powder-actuated tool for fastening HVB shear connectors  | 134 |
| DX 76            | Powder-actuated tool for fastening gratings and checker plates   | 135 |
| DX 76            | Powder-actuated tool for fastening heavy duty applications   | 135 |
| DX-860-ENP       | Powder-actuated tool for fastening metal decks   | 136 |
| DX 860-HSN       | Powder-actuated tool for fastening metal decks   | 136 |
| DX 9-ENP         | Digitally enabled powder-actuated tool for fastening metal decks   | 137 |
| DX 9-HSN         | Digitally enabled powder-actuated tool for fastening metal decks   | 137 |
| Cartridges - Pro | pellants for powder-actuated tools   | 138 |
| Gas-actuated to  | ols  | 139 |
| GX 90 WF         | Gas-actuated tool for wood framing   | 139 |
| GX 120           | Gas-actuated tool for interior finishing applications  | 140 |
| GX 120-ME        | Gas-actuated tool for mechanical and electrical applications   | 140 |
| GX 3             | Gas-actuated tool for interior finishing and building construction applications  | 141 |
| GX 3-ME          | Gas-actuated tool for mechanical and electrical applications   | 141 |
| GX 2             | Gas-actuated tool for interior finishing and building construction applications  | 142 |
|                  |  |     |

| Gas cans        |  | 142 |
|-----------------|--|-----|
| Battery-actuate | d tools  | 143 |
| BX 3-BT         | Battery-actuated tool for multi-purpose and electrical connection      |     |
|                 | applications   | 143 |
| BX 3-BTG        | Battery-actuated tool for fastening gratings                           | 143 |
| BX 3-IF         | Battery-actuated tool for interior finishing and building construction | n   |
|                 | applications   | 144 |
| BX 3-ME         | Battery-actuated tool for mechanical and electrical applications       | 144 |
| BX 3 02         | Battery-actuated tool for mechanical and electrical applications       | 145 |
| BX 3-L 02       | Battery-actuated tool for interior finishing, mechanical and electric  | al  |
|                 | and building construction applications                                 | 145 |

| Part 4: Fasteners |  | 149 |
|-------------------|--|-----|
| Siding and decki  | ng nails   | 151 |
| X-ENP             | Siding and decking nail                              | 151 |
| SDK2, PDK2        | Sealing cap for cladding fastening                   | 161 |
| X-ENP2K           | Siding and decking nail                              | 163 |
| X-HSN 24          | Diaphragm decking nail                               | 169 |
| NPH               | Siding and decking nail                              | 173 |
| Shear connector   | s  | 177 |
| X-HVB             | Shear connector                                      | 177 |
| General purpose   | nails  | 185 |
| X-X               | Nail for fastening to concrete and steel             | 185 |
| X-U               | Nail for fastening to concrete and steel             | 199 |
| X-P               | Nail for fastening to concrete and steel             | 211 |
| X-C               | Nail for fastening to concrete and sand lime masonry | 227 |
| X-S               | Nail for fastening drywall track to steel            | 233 |
| DS                | Heavy-duty nail for fastening to concrete and steel  | 237 |
| EDS               | Nail for fastening to steel                          | 243 |
| X-R               | Stainless steel nail                                 | 249 |
| X-CR              | Stainless steel nail for fastening to steel          | 257 |
| X-CR              | Stainless steel nail for fastening to concrete,      |     |
|                   | sand lime masonry and steel                          | 265 |
| X-CT              | Nail for forming or other temporary use              | 273 |
|                   |  |     |

| Threaded studs    |   | 277 |
|-------------------|---|-----|
| DX-Kwik –         |   |     |
| X-M6 H, X-M8 H    |   |     |
| and DNH, X-DKH    | Threaded studs and nails  | 277 |
| X-M6, X-W6,       |   |     |
| X-M8, M10, W10    | Threaded stud for fastening to concrete                           | 283 |
| X-EM6H, X-EW6H    | √,  |     |
| X-EF7H, X-EM8H    | ,   |     |
| X-EM10H,          |   |     |
| X-EW10H           | Threaded stud for fastening to steel                              | 289 |
| X-BT              | Stainless steel threaded stud                                     | 299 |
| X-BT              | New Generation stainless steel threaded stud                      | 305 |
| X-BT-MF           | Composite threaded stud   | 315 |
| X-BT-MR-N         | Stainless steel threaded stud for narrow through hole             | 323 |
| S-BT              | Screw-in stainless steel and carbon steel threaded stud           | 331 |
| X-ST-GR           | Stainless steel threaded stud for fastening to steel              | 345 |
| X-CRM             | Stainless steel threaded stud for fastening to concrete and steel | 349 |
| X-BT-ER           | Stainless steel threaded stud for electrical connection           | 353 |
| S-BT-ER,          |   |     |
| S-BT-EF           | Screw-in stainless steel and carbon steel threaded stud           | 359 |
| Standoff adapter  | rs  | 373 |
| Grating fastening | g system  | 387 |
| X-FCM             | Grating fastening system  | 387 |
| X-FCM, X-FCM-F    | ,   |     |
| X-FCM-R           | Securing grating with standard disc                               | 397 |
| X-FCM-F L,        | Securing grating with large disc with medium and high corrosion   |     |
| X-FCM-R L         | resistance  | 409 |
| X-FCM-R HL        | Securing grating under high load with medium and high corrosion   |     |
|                   | resistance  | 419 |
| X-FCM-F NG,       | Securing narrow grating with medium and high corrosion            |     |
| X-FCM-R NG        | resistance  | 427 |
| X-FCI-M           | Grating fastening system  | 437 |
| X-GR              | Grating fastening system  | 447 |
| X-FCS-R           | Grating element   | 457 |
| X-PGR-RU          | Grating fastening system (pre-drilled)                            | 469 |
| X-MGR             | Grating fastening system  | 475 |
| X-FCP             | Checker plate fastening system                                    | 479 |

| Insulation fasten | ners  | 487 |
|-------------------|---|-----|
| X-IE-G            | Insulation fastener                                     | 487 |
| X-IE              | Insulation fastener                                     | 497 |
| XI-FV ETICS       | Insulation fastener                                     | 507 |
| X-SW              | Soft washer   | 511 |
| Form stop faster  | ners  | 523 |
| X-FS              | Form stop   | 523 |
| X-DFS             | Double form stop  | 529 |
| Gas-actuated to   | ol fastening system                                     | 533 |
| X-EGN, X-GHP,     |   |     |
| X-GN              | Fastener for gas-actuated tool                          | 533 |
| GX 3 System       | Fastener for interior finishing, building construction, |     |
|                   | mechanical and electrical application                   | 539 |
| GX 2 System       | Fastener for interior finishing application             | 551 |
| Battery-actuated  | d tool fastening system                                 | 555 |
| BX 3 System       | Fastener for interior finishing, building construction, |     |
|                   | mechanical and electrical application                   | 555 |
| Hanger fasteners  | s   | 573 |
| BX-Kwik           | Electrical hanger system                                | 573 |
| X-HS and X-CC     | Threaded hanger and loop hanger system                  | 577 |
| X-MW MX,          |   |     |
| X-MW ALH          | Wire hanging system                                     | 585 |
| X-EHS MX,         |   |     |

Part 1:

Direct fastening principles and technique

# 1. Introduction

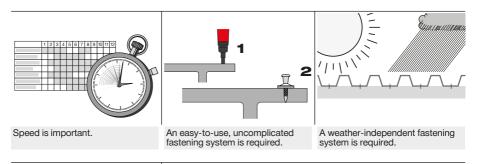

#### 1.1 Definitions and general terminology

Hilti direct fastening technology is a technique in which specially hardened nails or studs are driven into steel, concrete or masonry by a piston-type tool. Materials suitable for fastening by this method are steel, wood, insulation and some kinds of plastic. Fastener driving power is generated

# 1.2 Reasons for using direct fastening

"The illustrations below show some of the main reasons why many contractors take by a power load (a cartridge containing combustible propellant powder, also known as a "booster"), combustible gas or by a battery. During the driving process, base material is displaced and not removed. In Hilti terminology, DX stands for "powder-actuated", GX for "gas-actuated" and BX stands for "battery-actuated" systems (i.e. propellant free)."

advantage of the benefits of powder-, gasor battery-actuated fastening.

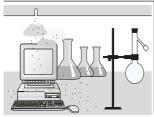

Electric power is not available or electric cables would hinder the work.

Drilling would cause too much dust.

In addition, there are specific reasons why contractors may use battery-actuated fastening:

Gas cans or combustion systems are not allowed

# 1.3 Direct fastening applications

Typical applications for powder- or gas-actuated fastening are shown in the illustrations below:

- Fastening thin metal sheets: roof decking wall liners and floor decking
- Fastening thicker steel members: e.g. metal brackets, clips
- · Fastening soft materials such as wooden

battens or insulation to steel, concrete or masonry

- Threaded studs for suspended ceilings, installing building services, bar gratings or chequer plate floors
- Connections for composite structures: fastening nailed composite shear connectors

Roof decking

Wall liners

Metal brackets, clips and tracks

Fixtures for mechanical and electrical installations

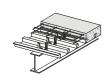

Hangers with threaded connectors

Wooden battens fastened to steel or concrete

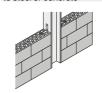

Grating fastenings

Shear connectors

System fortmwork

Wall-tie to steel and concrete

Mechanical and electrical fixtures

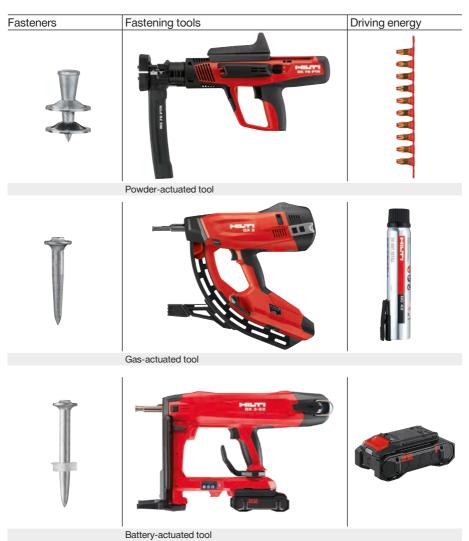

Drywall track to concrete and steel

# 2. The direct fastening system

The fastener, tool and driving energy form a fastening system with its own specific characteristics. Examples of Hilti direct

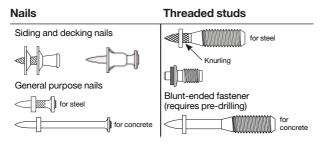

fastening system components are shown below.

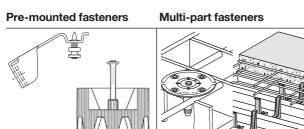

#### 2.1 Fasteners

Fasteners can be classified in three general types: nails, threaded studs and composite fasteners.

The nails used (also known as drive pins) are of a special type equipped with washers to meet the needs of the application and to provide guidance when driven. Threaded studs are essentially nails with a threaded upper section instead of a head. Composite fasteners are an assembly consisting of a nail with an application-specific fastening component such as a clip, plate or disk made of metal or plastic.

Siding and decking nails can be recognized by their washers which are specially designed to hold down the metal sheets and to absorb excess driving energy. Fasteners designed for driving into steel usually have knurled shanks which increase their pull-out resistance. Fasteners for use on concrete have longer shanks than those for use on steel. Threaded studs may have either a metric (M6, M8 or M10) or Whitworth (1/4", 5/16" or 3/8") thread.

Nails and threaded studs are commonly zinc-plated for resistance to corrosion during transport, storage and construction. As this degree of protection is inadequate for long-term resistance to corrosion, use of these zinc-plated fasteners is limited to applications where they are not exposed to the weather or a corrosive atmosphere during their service life. The zinc layer on

fasteners driven into steel is, in fact, a disadvantage in that it reduces pull-out resistance. For this reason, the thickness of zinc on the fastener must be optimized to ensure good corrosion protection as well as high holding power. During production, tight control of the galvanizing process is necessary to prevent excess zinc thickness and thereby poor fastening performance. Fasteners must be 2 to 3 times harder than the material into which they are driven. The tensile strength of structural steel is

commonly between 400 and 600 MPa. Fasteners for use on steel thus require a strength of approximately 2000 MPa. As Rockwell hardness is much easier to measure than strength, but good correlation exists between hardness and strength, this characteristic is used as a parameter in the specification and manufacturing of the fasteners. In the table below, HRC hardness is given for a range of tensile strengths (DIN 50150).

| Tensile streng | th   |      |     |      |      |      |      |      |      |
|----------------|------|------|-----|------|------|------|------|------|------|
| (MPa)          | 770  | 865  | 965 | 1810 | 1920 | 1995 | 2070 | 2180 | 2215 |
| HRC            | 20.5 | 25.5 | 30  | 52.5 | 54   | 55   | 56.5 | 58   | 59   |

# 2.2 Manufacturing process

# Standard hardened steel fasteners

Almost all power-actuated fasteners used throughout the world are manufactured from carbon steel wire which is subsequently thermally hardened to provide the strength needed for driving into steel and concrete. In nail manufacturing, shank diameter is determined by the wire diameter used. Threaded studs are made from wire corresponding to the required thread diameter. The manufacturing process, which is summarized in the diagram below, consists of cutting the wire to length, shaping the head, knurling, forging or thermo pulling the point, hardening, galvanizing and assembling with washers. The process of hardening the steel to more than HRC 50 combined with the zinc plating presents a risk of hydrogen embrittlement. This risk is mitigated by heat-treating the

galvanized product at the optimum temperature for the correct time. Galvanized and heat-treated fasteners are subjected to impact bending tests to check the effectiveness of the process. Depending on their intended application, some fasteners are additionally sampled and tested under tension and shear.

# Manufacturing Process

Cutting to length and head forming

(Knurling)

Point forging or thermo pulling

Thermal hardening

Galvanizing

Heat treatment

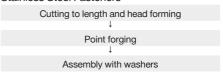

Assembly with washers

#### Stainless steel fasteners

Hilti introduced the first powder-actuated stainless steel fastener in 1994. These fasteners, which are not thermally hardened, are manufactured from special stainless steel wire with an ultimate tensile strength of 1850 MPa. One effect of using steel of such high strength as a raw material is that the forming and forging processes present greater technical difficulties. These fasteners, on the other hand, suffer no

risk of hydrogen embrittlement and their strength decreases only very slightly when subjected to high temperatures such as in a fire.

Manufacturing Process
Stainless Steel Fasteners

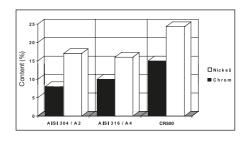

#### 2.3 Fastener raw material

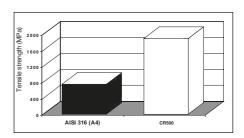

Hilti standard zinc plated fasteners are made from carbon steel wire with an ultimate tensile strength of 590 to 760 MPa.

Hilti X-CR / X-BT stainless steel fasteners are made from high-strength nitrogen alloyed stainless steel wire (Hilti designation CR500) or ferritic-austenitic corrosion resistant duplex steel 1.4462.

Nickel and chromium are the components of stainless steel that make it resistant to corrosion. CR500 steel is compared to commonly used stainless steels like AISI 304 and 316 (European A2 and A4) in the graph at the right. Note that CR500 steel contains considerably more nickel and chromium than both 304 and 316.

Another comparison of interest is the difference in ultimate tensile strength, as shown in the graph at the right.

# 2.4 Types of Hilti direct fastening tools

Hilti currently offers three types of direct fastening tools: powder-actuated, gas-actuated and battery-actuated.

# 2.4.1 Powder-actuated tools

These tools rely on cartridges of different power levels as propellant. When ignited, the cartridge transfers energy to a piston which, in turn, drives the fastener into the base material.

All Hilti powder-actuated tools are classified as low-velocity tools.

| Class of powder-actuated tool | test velocity | Maximum single test velocity in m/s [fps] |  |
|-------------------------------|---------------|---|--|
| Low-velocity                  | 100 [328]     | 108 [354]                                 |  |
| Medium-velocity               | 150 [492]     | 160 [525]                                 |  |
| High-velocity                 | >150 [492]    | >160 [525]                                |  |

#### 2.4.2 Gas-actuated tools

These tools rely on gas as propellant. Expanding the gas transfers energy to a piston which, in turn, drives the fastener into the base material.

Hilti manufactures gas-actuated tools using two distinct technologies. The first (used notably in models GX 2 and GX 90 WF) uses a fan to mix the propellant with ambient air. The second (used notably in the GX 120 and GX 3) uses a Hilti-designed mechanism requiring no external power to mix the gas and air in the combustion chamber.

#### 2.4.3 Battery-actuated tools

This tool is propellant-free. The energy moving the piston is generated by an electrical motor, two springs and a belt. The only source of energy required is a 22V battery which is interchangeable with other tools from the Hilti 22V platform family.

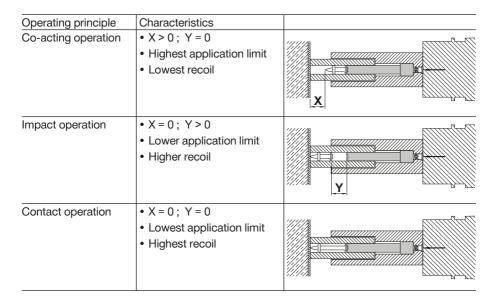

# 2.5 Operating principles

All Hilti direct fastening tools feature a piston. There are three ways the piston can come into contact with the fastener when an operator triggers a tool – referred to as operating principles. They are described in the diagram below.

It is important to bear in mind that the operating principle used for a given fastening point modifies the application's limit, particularly when fastening on steel.

It should be noted that 100% co-acting operation in Hilti tools can be only achieved by pushing the fastener all the way against the piston with a ramrod or, if the tool is so designed, with a built-in ramrod mechanism. Tools with nail magazines cannot operate with 100% co-action because of the need for clearance between the piston end and the collated nail strip. Some single-shot tools allow the operator to make an impact-type tool work as a co-acting tool by using a ramrod.

# 2.5.1 Cartridges (power loads, boosters)

Cartridges for powder-actuated fastening tools are available in various standard sizes and each size is available in up to 6 power levels. In the United States, the powder in a cartridge, the sensitivity of the primer, and the cartridge dimensions are governed by technical data published by the Powder-Actuated Tool Manufacturers Institute, Inc.

(PATMI). PATMI defines the power level by the velocity measured in a standard test in which a standardized 350 grain [22.7gram] cylindrical plunger is fired from a standardized apparatus. The identification and limitations of use are addressed in ANSI A10.3-2013.

#### PATMI colour codes, power levels and definition of cartridges

| Size            | Colour code    | Power<br>level | Velocity of 350 grain slug<br> ft./sec.  [m/sec.] |              | Calculated energy (joules)<br> minimum  average  maximum |     |     |
|-----------------|----------------|----------------|---|--------------|--|-----|-----|
| 6.8 / 11        | Gray           | 1              | 370 ± 45  | [113 ± 13.7] | 111  | 144 | 182 |
| [Cal. 27 short] | Brown          | 2              | 420 ± 45  | [128 ± 13.7] | 148  | 186 | 228 |
|                 | Green          | 3              | 480 ± 45  | [146 ± 13.7] | 200  | 243 | 291 |
|                 | Yellow         | 4              | 560 ± 45  | [171 ± 13.7] | 280  | 331 | 386 |
|                 | Red            | 5              | 610 ± 45  | [186 ± 13.7] | 337  | 392 | 452 |
|                 | Purple / black | 6              | 660 ± 45  | [201 ± 13.7] | 399  | 459 | 524 |
| 6.8 / 18        | Green          | 3              | 550 ± 45  | [168 ± 13.7] | 269  | 319 | 373 |
| [Cal. 27 long]  | Yellow         | 4              | 630 ± 45  | [192 ± 13.7] | 361  | 419 | 480 |
|                 | Blue           | 4.5            | 725 ± 45  | [221 ± 13.7] | 488  | 554 | 625 |
|                 | Red            | 5              | 770 ± 45  | [235 ± 13.7] | 554  | 625 | 700 |
|                 | Purple / black | 6              | 870 ± 45  | [265 ± 13.7] | 718  | 798 | 883 |

In Europe, the European Standard EN 16264 specifies cartridge dimensions, colour codes and power levels, which are defined in terms of energy delivered when a cartridge is fired in a standardized apparatus. EN 16264 specifies a 80 gram plunger.

# EN 16264 colour codes, power levels and energy scale

| Colour code | Power<br>level | Energy scale |
|-------------|----------------|--------------|
| White/Brown | weakest        | 2            |
| Green       | weak           | 3            |
| Yellow      | medium         | 4            |
| Blue        | heavy          | 5            |
| Red         | very heavy     | 6            |
| Black       | heaviest       | 7            |

# 3. Health and safety

The safety of powder-actuated fastening systems can be clustered into two categories:

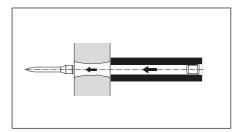

- Operator safety refers to safeguarding the operator and bystanders.
- Fastening safety refers to the adequacy of the in-place fastenings.

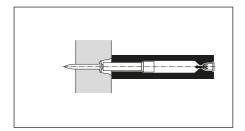

#### 3.1 Operator safety

This refers to the measures taken to ensure that the tool does not endanger the operator and/or bystanders by firing at an overly high velocity, firing under the wrong conditions, generating excessive noise, or being used in the wrong way.

# The piston principle

One of the main concerns about the use of powder-filled cartridges is the risks associated with a fastener missing the base material, or with a base material too weak to absorb the nail's energy. The piston principle ensures that the energy from the propellant in the cartridge is transferred to a piston which, in turn, drives the fastener. Because the piston is captive within the tool, it will absorb app. 95% of the driving energy in case a fastener misses the base material or the material is too soft for the fastener. As a consequence, the fastener will exit the tool at a speed that is far lower and less dangerous than that of tools which are not based on a piston.

#### Tool safety mechanisms

To minimize the potential hazards during tool usage, Hilti has implemented the following safety mechanisms in all of its direct fastening tools.

# **Drop-firing safety**

The drop firing safety mechanism prevents the tool from firing if dropped unintentionally. This mechanism is so designed that the tool, cocked or uncocked, will not fire when dropped at any angle onto a hard surface.

# **Trigger safety**

The trigger in Hilti's DX- and GX-tools is uncoupled from the firing pin mechanism until the tool is fully compressed against the work surface. This mechanism ensures that pulling the trigger alone cannot cause the tool to fire.

# Contact pressure safety

Hilti's direct fastening tools can only operate when pressed against the work surface. This requires a force of at least 50 N (5.1 kg, or 11.2 pounds). Tools with large base plates, such as DX 76 and GX 120, feature an additional surface contact pin that must also be pressed to allow the tool to operate.

#### Unintentional firing safety

Hilti's direct fastening tools will not operate unless first pressed against a work surface and then actioned using the trigger. This Hilti-designed feature ensures that no fastener exits a tool without the operator specifically intending it and focusing on the tool.

# Powder cartridges and operator safety

EN16264 requires submitting each cartridge to overpressure tests in each of the tools for which it is intended. This ensures that the plastic collation strip is of adequate strength. EN16264 also defines the maximum amount of unburnt powder a cartridge may leave after combustion, as this residue may explode and cause injuries to the operators and to bystanders. Meeting this requirement is a prerequisite for CE conformity.

The Hilti cartridges come in packages that address all the norms mentioned above. Each package displays cartridge energy level, marking on US scale and on European scale, in addition to the CE marking and CIP logo, as in the following picture illustrated.

The identification and limitations of cartridge use in the U.S. are addressed in the ANSI/ASSE A10.3 norm.

Always review and follow the Operating Instructions in addition.

#### Gas cans and operator safety

Norms and standards relevant to gas cans include EN12205 and ISO 11118 as of 2018, which regulate the physical structure of gas cans. They also include the UN 1950 or UN 3150 norms, which define the conditions under which gas can shipping and distributing is considered safe. Regional regulations also apply depending on the operator's location: ADR/RID for Europe and ORM-D for the United States. All Hilti gas cans strictly abide by these norms.

To ensure that Hilti's gas cans are used in the appropriate conditions, each can features safety information in text and pictogram formats. In particular, it displays its expiry date, the maximum temperature it may exposed to, its pressure level, and the "Extremely flammable" logo. The enclosing package also displays this information, in addition to recommended storage conditions. And the accompanying leaflet provides the complete list of potential hazards associated with the gas can.

#### GC 42 for use with the Hilti GX 3 tool.

For professional use only, Strictly for intended use only, Read the operating instructions and the safety regulations before use. Keep out of reads of children. See adapt of can for synarization adds and for unimber. Extremely filammable gas, Contains, gas under keep out of reads of children. See adapt of the contains is subutiane, Propene, Propane. Keep away from heat/sparks/open filames/hot surfaces. — No smoking. Store the container in a well ventilated place. Recommended storage temperature. 5°C to 25°C d14°F. O 17°F.].

#### GC 42 Gasdose zur Verwendung im Gerät Hilti GX 3.

Nur für professionellen Gebrauch. Benutzung ausschlieselich gemäs Verwendungszweck. Vor der Inbetrichen hime Bedienungsniebung und die Schenhelsvorschriften lesen. Darf incht in die Härde von Kndern gelangen, ferfallsfehahme Bedienungsniebung und die Schenhelsvorschriften lesen. Darf incht in die Härde von Kndern gelangen, ferfallsfehan dahrielt as siehe Besarrand. Ertem entzindlares Gas. Enthall Gas unter Bruck kann hel Erwärmung zupliorien. Enthält Issaultan, Prepan. Prehälter sieht unter Druck. Nicht durchstechen oder verbrenden, auch nicht nach der Verwendungt. Vor Sonnenbestrahlung schülzen und nicht Temperaturen von mehr als 50 °C/122° aussetzen. Nicht gegen offene Flamme oder andere Zindquelle sprühen. Von Hitze/Flukenfolfener Flammehallen Oberfächen ferhalten in klind rauchen. Nur int gelüfteten Bereichen verwenden. Behälter an einem gut gelüfteten Ort aufbewahren. Empfohlene Lagertemperatur 5°C bis 25°C 41°F bis 77°F.

#### GC 42 pour système Hilti GX 3.

tiús 42 paur systeme intri tax 3.

Usager déservé aux professionnels, uniquement dans le cadre d'une utilisation normale. Lire le manuel D'utilisation et toutes les instructions de sécurité avant utilisation. Tenir hors de portée des entants. Bate d'expiration sur la bordure de la carbunche. Baz extrémement lifamiable. Contient un gaz sous pression; peut expisers sous l'étile de la chaleur. Contient: Isolutane, Propien. Récipient sous pression; ne pas perfore, ni brûler, même aprés usage. Protéger du rayonnement solaire. Ne pas exposer à une température supérieure à 50 °C/12 2°F. Ne pas vapories arun en flamme nue ou sur toute autre source d'ignition. Tenir à fécart de la chaleur/des étincelles/dés flammes nues/des surfaces chaudes. - Ne pas fumer. Stocker les cartouches dans un endroit ble mettilés. Température recommandée pour le stockae; 5°C à 25°C (41° à 77°F).

To enable the efficient tracking of any issue, the production lot number is also printed on each gas can and package.

The side illustration shows the typical graphical layout of a Hilti gas can.

The Hilti tools only operate with Hilti gas cans. This ensures that the tool receives gas in the right amount and composition, minimizing safety risks.

# Noise-related operator safety

Hilti measures the noise its direct fastening tools emit as per the EN 15895 international standard to help operators and safety engineers plan the work in a way that minimizes risks. However, it should be noted that other ambient construction noises frequently compound with the tool's noise, which warrants additional precautions to protect operators. As a general rule, operators should always wear ear protection when operating the tools.

#### Vibration-related operator safety

Hilti direct fastening tools are not considered to produce vibrations as defined in international standards. However, as a precautionary measure, it is recommended to use the weakest possible cartridges to perform any given task, as well as to follow the instructions contained in the IFU.

# Promoting operator safety through signaling and documentation

To ensure the safety of the operator and of bystanders, it is essential to follow the instructions contained in the Operating Instructions. Safety measures are also featured on pictograms inside the product carrying cases and on the consumables.

Hilti also covers safety measures as part of the operator training modules its local offices offer. The operators completing training receive a certificate of completion and/or an operator ID as required by local regulations. In some countries, the operators also get access to online material that serves as a refresher.

# 3.2 Fastening safety

The safety of a fastening point depends for a good part on the manufacturer correctly anticipating the conditions in which its tools and fasteners will be used on jobsites. This involves:

- 1) engineering and testing fastening systems within the framework of specific applications
- 2) ensuring that the finished products strictly match their technical specifications
- 3) ensuring that the fastening work on jobsites is performed as it is intended to be

# **Engineering and testing**

Sources of information about the engineering and testing of a fastening system include the manufacturer's technical literature, official approvals and publications in technical journals. Hilti provides all of these for its products.

The use of a non-Hilti fastening system by an operator should be made contingent upon proof that the fastening system has been engineered and tested for the application the operator intends to perform.

#### Finished product quality

It is important that the manufacturer have a production quality control system. This is necessary for ISO 9001 certification. All Hilti production facilities are 9001 certified.

#### 3.3 Quality of installation

Hilti contributes to the quality of the fastening work in the four following ways:

- 1) It provides application guidelines.
- 2) It provides technical advisory services.
- 3) Each box of nails designed and/or approved for specific applications comes with a plastic gauge enabling the operator to check if the nail's stand-off on the base material is within the acceptable margin 4) It manufactures devices enabling the tensile testing of fasteners. Threaded studs and certain decking fasteners can be tested in their final position on a jobsite. Other fasteners can be tested using a pull-over test specimen.

Checking the standoff of an ENP2 roof deck fastening with a plastic gauge

Pull-out test of an ENP fastening with a HAT28 tester and X-ENP adapter

As construction professionals demand fastening systems that are dependable without question, Hilti integrates functional reliability into the development, manufacturing, selling and servicing of its fastening systems. It does so paying particular attention to the reliability level required of each system, and the conditions in which it will be used.

During the development phase, Hilti engineers test the reliability of prototypes and system components regularly. In the plant, quality controls take place throughout the manufacturing process to ensure that the products are produced according to specifications.

When the first pilot production lots are delivered, contractors test them on jobsites. Adequate performance by the pilot production lots ensures that the products will be of good quality when mass-produced.

Hilti's sales staff gets trained to be in a position to advise customers on which system to use for their application, demonstrate how to use tools, and warn them about potential hazards.

Finally, Hilti's highly skilled tool repair and maintenance staff ensures that the fastening system functions optimally over the long run.

# 4. Corrosion

For decades, Hilti is concerned about corrosion of fastening systems and has gained a lot of experience in this area based on laboratory- and field tests. Extensive testing and research are conducted in test facilities of Hilti Corporate Research department, located around the world in different climate zones.

Hilti strives to provide the best possible

support to customers for selecting the right product for safe and reliable fastening solutions.

This chapter gives an overview of corrosion protection solutions for Hilti Direct Fastening elements. More details on corrosion are described in the Hilti corrosion brochure "Corrosion handbook 2015".

# 4.1 Corrosion protection of direct fastening systems

Carbon steel fasteners are subject to corrosion (red rust) when exposed to humidity.

Zinc is the coating most commonly applied on fasteners. Humidity attacks it before it attacks the carbon steel core. Thanks to Zinc's electro-chemical properties, this produces white rust on the coating but delays the formation of red rust on the core material.

Zinc has different removal rates depending on the surrounding environment.

The lifetime of zinc-based protection against corrosion is a function of two parameters: the environment's aggressiveness and the zinc's thickness. Depending on the degree of anti-corrosion protection required, additional layers of Zinc can be applied through passivation or organic topcoat.

Different variants of coating systems can be used to prevent fasteners from rusting. They are described in the following paragraphs.

#### Galvanic zinc coating:

This type of coating is generally suitable for environments with no corrosive potential. It is typically applied via an electrochemical process. Thicknesses up to 20 microns are possible, including passivation layer.

#### Hot dip galvanizing (HDG):

HDG is applied by dipping the parts to be protected against corrosion in a liquid zinc bath. The coating thickness can reach up to 80-100 microns, offering additional protection compared to galvanic zinc.

#### **Duplex coating:**

An alternative to hot dip galvanizing is duplex coating, i.e. the combination of a galvanic zinc layer with an supplemental reactive sealer the zinc in a first period. The equivalence in the protection offered by duplex coating and by HDG has been demonstrated on numerous occasions at Hilti test facilities around the world as well as at independent external labs. Duplex coating is applied to many Hilti grating fasteners, X-FCM-M.

#### Mechanical zinc plating:

Another alternative to hot dip galvanizing is mechanical plating. In this process, the zinc layer is built from zinc powder that is mechanically pressed onto the surface of the parts to protect. The equivalence in the protection offered by mechanical zinc plating and by HDG has been demonstrated on numerous occasions at Hilti test facilities around the world as well as at independent external labs.

Mechanical plating is applied on some Hilti nails and pins used in direct fastening.

# Hydrogen embrittlement:

Hydrogen embrittlement is a specific corrosion phenomenon of zinc plated DX fastening elements, which will occur if three different conditions are present simultaneously:

- High strength carbon steel (>1000 MPa)
- · Presence of hydrogen
- Tensile stresses

The combination of these three parameters leads to a decrease in the material's ductility, which may cause a sudden fastener failure even under very low static load.

The strength of fasteners is a function of its design and of the acceptable load in each application. Therefore, it is important to control the presence of hydrogen in the fasteners to prevent embrittlement from occurring. There are two main sources of hydrogen for zinc plated fasteners:

- The production process (primary hydrogen embrittlement): Hilti's power actuated fasteners are thoroughly tested and controlled during the production process to prevent primary hydrogen embrittlement.
- The corrosion process in the application (secondary hydrogen embrittlement): When zinc plated, high-strength fasteners are used in wet atmosphere, hydrogen is formed by the chemical reaction of zinc and water and diffuses into the material. To avoid secondary hydrogen embrittlement during the service life of a fastener, it is essential to follow the recommended application conditions provided for each nail in Hilti technical documents.

#### Stainless steel

Stainless steel comes in many different types, each of which has different corrosion resistance properties. A stainless steel material used in a wrong environment can lead to pitting corrosion and, subsequently, sudden fastener failure. In such a situation, predicting a fastener's lifetime is not possible.

Hilti power actuated fasteners are manufactured using CR500 and 1.4462 material, similar to A4 (AISI grade 316), which offers high performance in a wide range of applications.

For higher corrosion requirements, fasteners made out of HCR (1.4529) material can be provided. The HCR (High Corrosion Resistance) material can be used in swimming pools and in road tunnels, where the performance of A4 material is not sufficient.

Stainless steel with pitting corrosion, e.g. A4 material used in a road tunnel

Suitable stainless steel used, e.g. HCR material used in a road tunnel

#### 4.2 Fastener selection

Following table (next page) gives a general guideline of commonly-accepted applications in typical atmospheric environments. Suitability of fastening systems for a specific application can be significantly affected by localized conditions, including but not limited to:

- · Elevated temperatures and humidity
- · High levels of airborne pollutants
- Direct contact with corrosive products, commonly found in chemically-treated wood, waste water or salt water, concrete additives, cleaning agents, etc.

- · Non-atmospheric corrosion like e.g. direct contact to soil, stagnant water
- · Cyclical wetting
- · Electrical current
- · Contact with dissimilar metals
- Physical damage or wear

|  |                      |   |   | Carbon steel                   |                                      | Stainless steel                      |               |

- = expected lifetime of power actuated fasteners made from this material is typically satisfactory in the specified environment based on the typically expected lifetime of a building. The assumed service life in ETA approvals for power actuated fasteners is 25 years.
- = fasteners made from this material are not suitable in the specified environment. Exceptions need a specific assessment
- 1) Outdoor exposure for up to 6 months during construction is permissible for high-strength electro-galvanized siding and decking fasteners such as the X-ENP (see instructions for use for details)
- 2) The reference to "non-safety relevant" is intended to distinguish applications where failure of the attachment will not create any potential safety risks or significant damage.

#### Remarks:

- The ultimate decision on the required corrosion protection must be made by the customer. Hilti accepts no responsibility regarding the suitability of a product for a specific application, even if informed of the applications conditions.
- This table is based on an average service life for typical applications.
- For metallic coating e.g. zinc layer systems the end of life time is the point where red
  rust is visible over a large percentage of the product and widespread structural
  deterioration can occur the initial onset of rust will occur much sooner
- National or international codes, standards or regulations, customer and/or industry specific guidelines must be independently evaluated.
- These guidelines apply to atmospheric corrosion only. Other types of corrosion, such as crevice corrosion or stress corrosion cracking must be independently evaluated.

A typical service life of Hilti GX-WF nails in wood - wood connections is shown below:

| :  | Service Cla                                    | sses in accordance with EN 1995<br>(Eurocode 5):  | Service<br>Class 1 | Service<br>Class 1,2 |                    | Service<br>Class 1,2,3 |    |

The table above provides typically assumed service life estimations based on corrosion considerations. Other factors determining the service life of fasteners must be evaluated separately.

<sup>=</sup> expected lifetime of nails made from this material is typically satisfactory in the specified environment based on the typically expected lifetime of a building.

<sup>— =</sup> nails made from this material are not suitable for the environment or the typical lifetime of a building is not achieved.

<sup>1)</sup> For nails made of A2 material, discoloration of nail heads can occur before the service life in the table above is reached. To avoid this, use A4 material.

#### Remarks:

- The use of certain wood species including, but not limited to, Oak, Douglas-fir or Western Red Cedar, require the use of stainless steel nails, independent of Service Class and environmental conditions.
- The use of certain wood treatments including, but not limited to, fire retardants or
  preservatives can change the chemical composition of the wood and may require the use
  of stainless steel nails, independent of Service Class and environmental conditions.
- The evaluation of corrosive environmental conditions depends on many factors and lies
  within the responsibility of the customer. The planned service life of the buildings or
  structures can be considered according to local or national building regulations and
  Eurocode (EN 1990)
- The table does not contain recommendations and Hilti does not assume liability for fastener selection based on its content.
- For the typical service life, it is assumed that the nails are selected, designed, installed and otherwise treated in accordance with Hilti's published literature.
- Local building regulations and trade rules may differ from the table above. The local jurisdiction always needs to be followed.
- Wood to steel connections may require a minimum corrosion protection, independent of the environmental conditions.

# 5. Steel base material

#### 5.1 Anchoring mechanisms

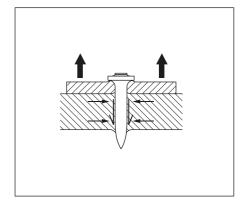

The following four mechanisms cause a fastener to hold when driven into steel:

- clamping
- keying
- fusing (welding)
- soldering

These mechanisms have been identified and studied by analyzing pull-out test data and by microscopic examination of fastening cross-sections.

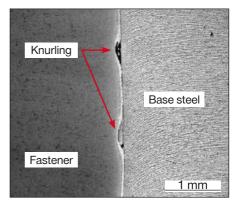

# Clamping

As a fastener is driven, the steel is displaced radially and towards both the entry and opposite surfaces. This results in residual pressure on the surface of the nail, which leads to friction or clamping. Clamping is the primary anchoring mechanism of throughpenetrating fasteners. This is indicated by the fact that when through-penetrating fasteners are extracted, the pull-out force decreases only slowly over several millimeters of displacement.

#### Keying

The keying mechanism is possible when the fastener is knurled, that is, it has fine grooves along the shank in which zinc and particles of base steel accumulate during the driving process. Microscopic examination of cross sections has shown that the grooves are not completely filled. Keying is an especially important anchoring mechanism for fasteners that do not penetrate right through the base material.

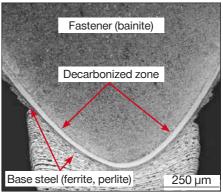

# Fusing (welding)

Complete fusing of the fastener with the base steel is indicated by portions of base material clinging to the extracted fastener. Fusing or welding is observed mostly at the point of a fastener where the temperature during driving can be expected to be the highest.

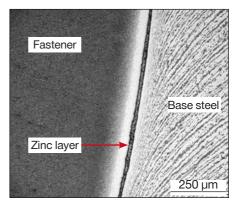

For fasteners that do not through-penetrate, this is an important anchoring mechanism. It can be relied upon only if the fastener point is manufactured without cracks and with an appropriate geometry. The thermo pulling process is ideal for achieving an optimized geometry. Control of all steps in the produtction process is necessary to avoid

# Soldering

In the zone further from the point, there is a prominent zinc layer separating the fastener from the base steel. This zinc, soldered to the base steel, also makes a contribution to the pull-out resistance of the fastener.

cracks in the point.

# Blunt-tipped fastener X-BT family

The X-BT fastener with a shank diameter of 4.5 mm is driven in a pre-drilled 4.0 mm diameter hole. This leads to displacement of the base material. Part of the base steel is punched down into the pre-drilled hole, generating high temperatures and causing friction welding. Due to elasticity of the base steel, additional clamping effects are also superposed.

Displaced base material can be clearly seen in the photograph. Base material adhering to the fastener shank indicates a welding effect.

# 5.2 Factors influencing pull-out resistance

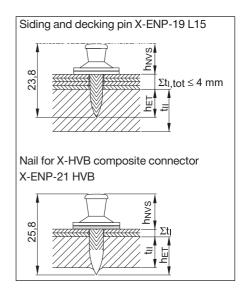

Powder-actuated fastening systems must be designed and manufactured to ensure that pull-out resistance will be adequate for the applications intended. Through understanding of the anchoring mechanisms, experience and testing, factors that influence pull-out strength have been identified. Some of these factors are:

- Depth of penetration in the base material
- Surface characteristics of the fastener
- Coatings on the steel base material
- · Driving velocity
- · Diameter of the fastener shank

Knowledge of the influencing factors is vital to the design of fastening systems and is useful for operators in understanding the various application guidelines and restrictions that apply to a fastening system. Some of the influencing factors are discussed in the following section.

Depth of penetration in the base material The depth of penetration of fasteners in steel is taken as the distance that the point travels below the surface of the base steel, independent of the steel thickness. In other words the depth of penetration hET can be greater than, equal to or less than the steel thickness.

Resistance to pull-out increases with increasing depth of penetration. This is also true for through-penetrating fasteners where hET is greater than the steel thickness. The design of a powder-actuated fastener has to take into account the depth of penetration necessary to achieve the pull-out resistance required for the application. Application guidelines published for any fastener include the required nail head stand-off h<sub>NVS</sub>, which corresponds to the penetration depth.

Guide values for the depth of penetration of specific fastener types are as follows:

Galvanized fastener with knurled shank:  $h_{\text{ET}} = 12 \text{ to } 18 \text{ mm}$  (shank diameter 4.5 mm)

 $h_{ET} = 10 \text{ to } 14 \text{ mm}$  (shank diameter 3.7 mm)

Galvanized fastener with knurled tip:  $h_{EI} = 9$  to 13 mm (shank diameter 4.5 mm)

Galvanized fastener with smooth shank:  $h_{\text{ET}} = 15 \text{ to } 25 \text{ mm}$ Stainless steel fastener with smooth shank:  $h_{\text{ET}} = 9 \text{ to } 14 \text{ mm}$ 

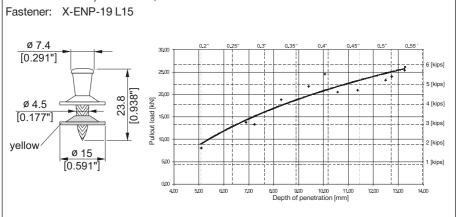

Blunt-ended fasteners:  $h_{ET} = 4 \text{ to } 5 \text{ mm}$ 

The effect of penetration depth on pull-out strength can be demonstrated in experiments in which the driving energy is varied so as to produce varying penetration. The results of a test of this kind are summarized below. The application recommendations for fasteners are based on tests like these and they clearly show the importance of carrying out the fastening installation in accordance with the recommendations of the manufacturer.

Steel:  $t_{II} = 20 \text{ mm } (0.787^{\circ})$ 

fu = 630 N/mm<sup>2</sup> (91.000 psi)

Tool: DX 76 / DX 76 PTR, DX 860-ENP and DX 9-ENP

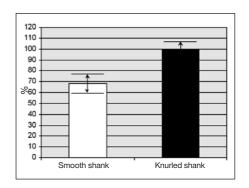

#### Knurling on the fastener shank

Fasteners for use in steel base material usually have knurling on the shank so as to improve the resistance to pull-out. The effect of the knurling was shown in a test with fasteners that had knurled and unknurled shanks, but were otherwise the same.

The benefit of knurling is clearly seen from the test results. With virtually the same penetration (actually 106%), the smooth-shank fastener had only 68% of the pull-out strength of the knurled-shank type. Even with the penetration increased to 137%, the pull-out strength was still only 81% of that of the knurled-shank fastener. In this test, the steel thickness of 10 mm (0.394") allowed through penetration of the steel. If the steel is too thick for through penetration, the beneficial effect of knurling becomes even more pronounced.

#### Zinc coating on the fastener shank

Zinc on a fastener shank appears to act as a lubricant that reduces its resistance to penetration into steel. Reduced pull-out strength is the result, because the lower resistance means less heat is generated, thus reducing the welding effect between the shank and the base steel. This was shown in an experiment with fasteners that were identical except for the thickness of zinc coating.

| Steel base ma              | terial: t <sub>II</sub> = 2                    | t <sub>II</sub> = 20 mm [0.787"],     |  |     |                      |  |  |
|----------------------------|--|---------------------------------------|--|-----|----------------------|--|--|
|                            | $f_u = 4$                                      | f <sub>u</sub> = 440 MPa [63,817 psi] |  |     |                      |  |  |
| Zinc<br>thickness<br>in mm | Average penetration h <sub>ET</sub> mm/[in.] % |                                       | Average ultimate pull-out load N <sub>u,m</sub> kN / [kip] % |     | Variation<br>CV<br>% |  |  |
| ca. 10                     | 12.12 [0.477]                                  | 100                                   | 8.53 / [1.918]   | 67  | 25.6                 |  |  |
| 2-5                        | 11.86 [0.470]                                  | 98                                    | 12.82 / [2.882]  | 100 | 9.3                  |  |  |

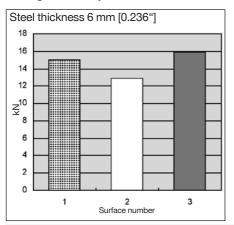

Although driving the fastener through sheet metal, as is the case when fastening siding and decking, reduces the negative effect of zinc coating on pull-out strength, the reason for tightly controlling the galvanization process is clear.

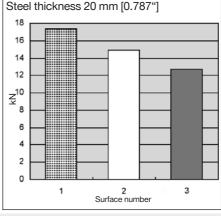

#### Surface of the steel base material

Corrosion protection of structural steel is often achieved by hot-dip galvanizing. Tests have shown that if the fastener penetrates right through the steel, the galvanizing has no significant effect on pull-out strength. In the case of fasteners that do not through-penetrate, pull-out strength is reduced by about 25%. The summary of results from one test is shown below to illustrate these effects.

#### Average ultimate pull-out loads

Ultimate tensile strength of steel: Surface of the steel:

- f<sub>u</sub> = 430 MPa [62,366 psi]
- 1. Rough with some slag and rust (reference)
- 2. Sandblasted
- 3. Pickled + hot-dip galvanized (min. 60 µm zinc)

Several important observations can be made based on these results:

- Pull-out loads in 6 mm (¹/₄") steel base material are much less affected by the surface
  condition of the steel than they are in 20 mm (³/₄") steel. The reason is that the main
  anchoring mechanism of through-penetration fastenings is clamping, which is not affected
  by the surface condition of the steel.
- Hot-dip galvanizing appears to reduce the pull-out strength of non-through-penetrating fastenings by nearly 30%. Note, however, that even with hot-dip galvanizing, the pull-out strength was still 12.5 kN (2.8 kips).
- The negative effect of hot-dip galvanizing is explained by the tendency of zinc on the fastener to act as a lubricant that reduces heat generation during driving. This in turn reduces the tendency of the fastener point to fuse to the base steel. Zinc from the coating on the base steel apparently becomes attached to the fastener as it enters the base steel. For applications where tensile strength of the fastening is critical and the steel has a heavy coating, the fastening system can be qualified by carrying out pull-out tests on site. If pull-out strength is not adequate, depth of penetration can be increased to improve the situation.

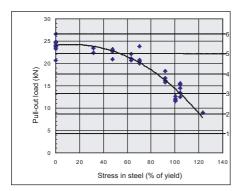

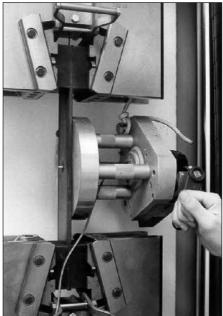

#### Tensile stress in the steel

The integrity of a powder-actuated fastening is dependent on a relatively smooth pin remaining anchored in structural steel. A large amount of test data, technical assessments, approvals and practical experience with powder-actuated fastenings is available to support use of powder-actuated fastening. Performance of fasteners anchored in the steel under tension was investigated by driving fasteners into unstressed steel plates and extracting them with the plates stressed in tension. The steel plates measured 6x80x455 mm [0.236"  $\cdot$  3.15"  $\cdot$  17.9"] and possessed two different yield stresses - 328.6 MPa [47.7 ksi] and 411.7 MPa [59.7 ksi].

By expressing the steel stress in terms of % of actual yield, it was possible to combine the data for both steel grades and obtain a reasonable curve fit.

Of significance to the designer is the expected decrease in pull-out strength of the fastener at a typical maximum allowable design stress of 60 to  $70\,\%$  of yield. At this stress, the pull-out strength reduction is less than  $15\,\%$ . The absolute value in the experiment was still greater than 2 tons.

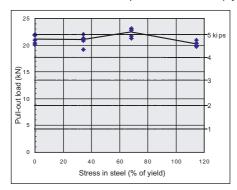

#### Compressive stress in the steel

Compressive stress in the base steel has no influence on the pull-out strength of the fastener. This was demonstrated by placing fasteners in unstressed 15 mm [0.59"] thick steel plates having a yield strength of 259.3 MPa [37.6 ksi] and extracting them while the plates were compressed in a testing machine.

The minimal variation in pull-out load is simply random variation experienced in testing.

# 5.3 Suitability of the steel for fastening

There are three main factors determining the suitability of a construction grade steel member for DX fastening:

- Steel thickness
- · Ultimate tensile strength
- · Flexibility of the base steel member

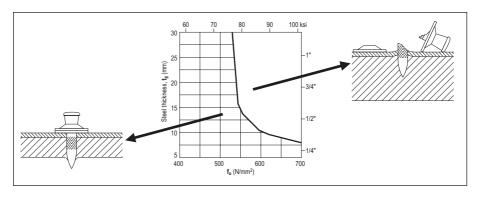

# 5.4 Application limit diagrams

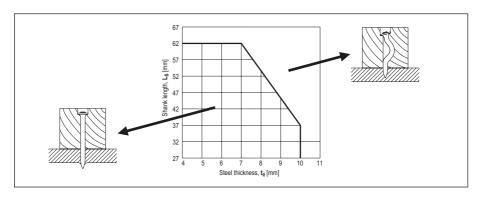

The application limit of a fastening system is a term applied to a combination of the maximum thickness  $t_{II}$  and ultimate tensile strength  $f_{u}$  of steel in which fastenings can be made. There are two general types of application limit diagrams:

- Short fasteners (e.g. siding and decking nails and threaded studs)
- · Long fasteners (e.g. nails used to fasten wood to steel)

The application limit line for a short fastener is a plot of steel thickness versus ultimate tensile strength. In situations represented by steel thickness / ultimate tensile strength combinations above and to the right of the line, some of the fasteners may shear off during driving. The failure surface will be roughly at a 45° angle to the shank length.

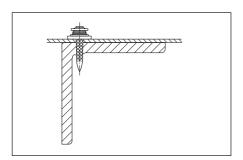

The application limit lines for long nails used to fasten wood to steel are plots of nail shank length  $L_{\rm S}$  versus steel thickness  $t_{\rm II}$ . Each line is valid only for one ultimate tensile strength of steel  $f_{\rm u}$ . Attempts at working to the right of the limit line result in buckled nail shanks.

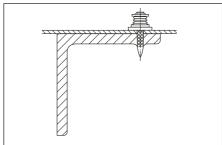

#### 5.5 Thin steel base material

In the context of powder-actuated fastening, steel is considered thin when flange deformation during driving dominates fastener design. When the steel flange is thinner than about 6 mm [0.25"], flange deformation makes use of fasteners with a 4.5 mm [0.177"] shank diameter more difficult and switching to a 3.7 mm [0.145"] shank fastener leads to better results. Use of fasteners with tapered shanks and energy-absorbing washers improves performance and reliability.

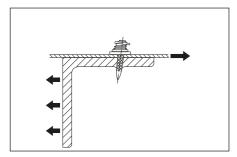

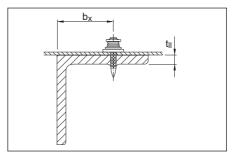

A fastener can penetrate into steel only when the steel (flange) develops a resistance greater than the force required for penetration. This implies the use of energy in excess of that required for penetrating into the steel. In fact, if the driving energy remains constant, fasteners placed closest to the web will be driven deepest. All siding and decking fasteners should have a mechanism to clamp the sheets down tightly over the entire range of allowable standoffs. This is especially critical for fasteners used for fastening to thin steel.

Obviously, under shear loading, failure of the base material is more likely with thin steel than with thick steel. When approving fastening systems for a project, it is important to consider whether the system has actually been tested with thin base steel or not.

Hilti's general recommendation for thin base steel fasteners is to place the fastenings within  $b_x = 8 \cdot t_{||}$  of the web.

# 5.6 Types of load and modes of failure

#### 5.6.1 Shear loads

The shear loads acting on siding and decking fasteners come from:

- · Diaphragm action of the fastened sheets
- Forces of constraint (for example due to temperature changes)
- Self-weight of siding material

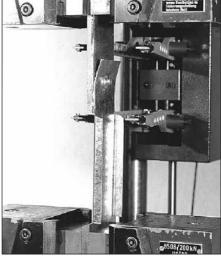

#### **Testing**

Shear testing of siding and decking fastenings is done using specimens made up of a strip of sheet metal fastened to a steel plate. Suitable, non-slip fixtures have to be used at either end. In some cases specimens are bent up at the sides to hinder eccentricity.

#### Failure of the fastened material

The load-deformation curves of shear tests with powder-actuated fasteners show a nearly ideal behavior. After an initial elastic phase during which the clamping force of the washers against the sheet metal is overcome, the sheet metal reaches its yield stress in an area where the fastener bears against it. Then the fastener shank cuts through the sheet metal until the end of the sheet is reached. The large area under the load-deformation curve represents energy absorbed, and this is what makes the fastening method ideal for diaphragms.

#### Failure of the base steel

If the thickness of the fastened sheet metal is large compared to the base steel thickness, bearing failure of the base material is a possible mode of failure.

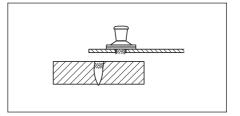

#### Pull-out from the base steel

The unavoidable eccentricity in the shear test specimen leads to a tensile load component on the fastener. Thick fastened material and thin base material is also involved in this mode of failure. This failure mode is generally not governing for base material thickness of  $t_{\rm II} > 6$  mm.

About 20 kN (4.5 kips) of force is required to shear the Ø 4.5 mm (0.177") shank of an X-ENP-19 L15 fastener. With about 2.5 mm (12 gauge) thick steel sheet as fastened material, a force of this magnitude could be possible. The force needed to break a Ø 3.7 mm (0.145") shank of an X-ENP2K-20 L15 fastener is about 13 kN (2.9 kips). This force can be generated with 1.5 mm (16 gauge) sheet steel. In practice, this failure mode is likely only where expansion joints are not provided to relieve forces of constraint from temperature differences.

#### 5.6.2 Tensile loads

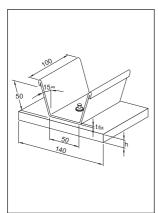

The most common source of tensile loading on siding and decking fasteners comes from wind suction acting on the roof or wall cladding. In diaphragms, fasteners can be subject to tensile loads in situations where the combination of geometry and thickness of decking fastened leads to prying. In designs with very stiff decking and wide beams or unbalanced spans, prying can also be caused by concentrated loads.

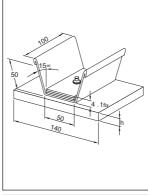

# **Testing**

Tensile testing of siding and decking fastenings is carried out using specimens made up of a trapezoidal-shaped piece of sheet metal fastened to a steel plate. Suitable, vice-like fixtures are used to grip the specimen. This is often referred to as a pull-over test because the common failure mode is the sheet pulling over the washers or the head of the fastener. If the sheet thickness fastened is increased so that pull-over does not govern, pull-out will be the failure mode.

Some fasteners like the Hilti X-ENP have a head that can be gripped and pulled out by a suitable fixture. With these fasteners, a pull-out test can still be done even if pull-over is the original mode of failure. This fastener type has the further advantage of allowing in-place fasteners on a jobsite to be tested.

Pull-over test specimen

Pull-over test specimen with 3 extra Test setup layers to simulate end lap - side lap

# Sheet pull-over

In this failure mode, the sheet tears and is lifted up over the fastener head and washers. Depending on the sheet thickness and tensile strength, the washers may be bent up.

#### Washer pull-over

Another possible failure mode is that of the washers being pulled up over the head of the nail. Obviously, this happens when the sheet is somewhat stronger and /or thicker than when sheet pull-over occurs. This failure mode is also heavily dependent on fastener design.

Pull-over test specimen at test start Sheet pull-over

Washer pull-over

#### Pull-out from the base steel

As sheet thickness and number of layers is increased, this failure mode becomes more likely. For a properly driven X-ENP-19 L15 pull-out from the base steel is not a likely mode of failure. The head and washer design of the HSN 24 or X-ENP2K-20 L15 fasteners can allow this failure mode, especially with multiple layers of sheets.

#### Fracture of the fastener

A force of more than 30 kN [6.7 kips] is required to break the Ø 4.5 mm [0.177"] shank of an X-ENP-19 L15 fastener and, even if sheet or washer pull-over does not govern, pull-out strengths of this magnitude are not very common. This mode of failure will therefore hardly ever occur with these heavy-duty fasteners. The Ø 3.7 mm [0.145"] shank of an X-HSN 24 or X-ENP2K-20 L15 fastener may break at about 20 kN [4.5 kips] tension. Since these smaller fasteners will pull out at a force of 8 to 15 kN [1.8-3.3 kips], fractures due to tensile loads are rare. If fractured fasteners of this type are found on a jobsite, the most likely cause is that the application limit has been exceeded (the base steel is too hard and/or too thick for the pin).

#### Cyclic loading

Siding and decking nails used in wall and roof construction are subject to cyclic loading from wind suction. Cyclic load testing is carried out to determine characteristic resistance and allowable (recommended) loads. The requirements of the European Technical Assessment ETA prepared by DIBt (Deutsches Institut für Bautechnik) govern the designrelevant number of load repetitions (5,000) and the necessary safety factors. Notes in this regard are found on the corresponding product data sheets.

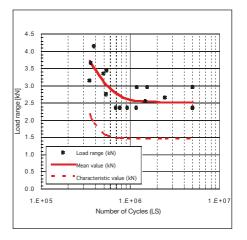

If the fastener will be subjected to a large number of load repetitions and fatigue, we recommend carrying out a design check according to the requirements of Eurocode 3 (or similar

code). Eurocode 3 gives the characteristic fatigue resistance and safety concept for steel construction. To carry out the check according to Eurocode 3 it is necessary to have a statistical analysis of test data obtained under the application conditions. Except for siding and decking fasteners, the applicable product data sheets limit the validity of recommended loads to predominantly static loading. If a design analysis has to be carried out for true fatigue loading, test data can be obtained from Hilti. Examples of such data are shown below.

# X-EM8-15-14 (standard zinc-plated fastener)

The X-EM8-15-14 has a shank diameter of 4.5 mm and a hardness of HRC 55.5 ( $f_u$  = 2,000 MPa). The  $\Delta$ **F**-N diagram shows the load range  $\Delta \mathbf{F}$  for a lower load of 0.05 kN. The individual test results are displayed as points and the curves show average and characteristic (95% survival probability) values. The failure mode was shank fracture or fracture in the M8 threading. The recommended load for predominantly static loading is 2.4 kN. Comparing this value to the  $\Delta \mathbf{F}$ -N diagram will lead to the conclusion that X-EM8-15-14 fastenings designed for 2.4 kN static loading will survive a large number of load repetitions. The fastenings can be said to be robust, even when the actual loading turns out to be in part cyclic.

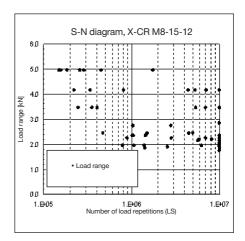

# X-CRM8-15-12 (stainless steel fastener)

The X-CRM8-15-12 has a shank diameter of 4.0 mm and a minimum ultimate tensile strength of 1,850 MPa. The  $\Delta F$ -N diagram shows the load range  $\Delta F$  for a lower load of 0.05 kN. The individual test results are displayed as points. The failure mode was shank fracture or fracture just below the head of the stud.

The recommended load for predominantly static loading is 1.8 kN. Comparing this value to the  $\Delta F$ -N diagram will lead to the conclusion that X-CRM8-15-12 fastenings designed for 1.8 kN static loading will survive a large number of load repetitions. The fastenings can be said to be robust, even when the actual loading turns out to be in part cyclic.

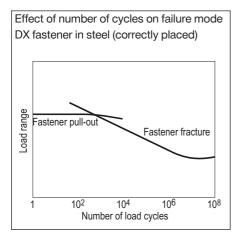

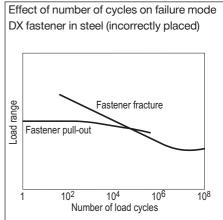

# Mode of failure under cyclic loading

A major finding of cyclic loading tests is that the strength of a DX fastening subject to cyclic loading is not limited by failure of the anchorage. It is only when the number of cycles is very low - i.e. predominantly static loading - that nail pull-out is observed. The two schematic diagrams below show the relationship between failure mode and number of cycles. All tests show that the anchorage of DX fasteners in steel and in concrete is extremely robust with regard to resisting cyclic loading. Fasteners subject to a large number of load repetitions fracture in the shank, head or threading. A condition for obtaining this behaviour is that the fasteners are correctly driven. Fasteners that are not

driven deeply enough exhibit low pull-out strength and in a cyclic loading test may not necessarily fail by fracture.

In older product information and data sheets, this basic suitability of DX fasteners for cyclic loading was emphasized by defining the recommended loads as cyclic recommended loads. At the time that this product information was assembled, a true safety concept for a strict check of DX fastenings subject to fatigue loading was not available. With Eurocode 3, this is today available. If a fatigue design analysis is carried out, it is important – as with static design – that adequate redundancy be provided.

#### Failure of the sheet

In cyclic load tests, failure of the steel sheet itself is common.

#### 5.7 Effect of fasteners on structural steel

Driving powder-, gas-, or battery-actuated fasteners into a steel member does not remove steel from the cross-section, but rather displaces steel within the cross-section. It is therefore not surprising that tests like those described in following sections show that both drilled holes and screws, either self-drilling or self-tapping, reduce the strength of a cross-section more than powder-actuated fasteners.

The results of the tests can also be used to show that it is conservative to consider a powder-actuated fastener as a hole. This allows the effect of fasteners in a steel member subject to static loading to be taken into consideration.

Fatigue seldom needs to be considered in building design because the load changes are usually minor in frequency and magnitude. Full design wind and earthquake loading is so infrequent that consideration of fatigue is not required. However, fatigue may have to be considered in the design of crane runways, machinery supports, etc. The S-N curves resulting from fatigue tests of steel specimens with fasteners installed are also presented.

#### 5.7.1 Effect on the stress-strain behaviour of structural steel

The effect that powder-actuated fasteners (PAF's) have on the stress-strain behaviour of structural steel was investigated in a systematic test programme using tensile test specimens containing PAF's, self-drilling screws and drilled holes. A control test was carried out using specimens without any holes or fasteners.

#### Series A:

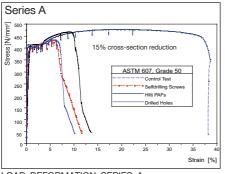

- ASTM 607, grade 50
- Cross-section 3.42 x 74 mm [0.135 x 2.913"]
- X-EDNK22 powder-actuated fasteners, shank diameter 3.7 mm [0.145"]
- Drilled holes, diameter 3.7 mm [0.145"]
- Self-drilling screws, shank diameter 5.5 mm [0.216"]

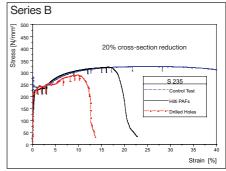

#### Series B:

- S235 and S355 steel
- Cross-section 6 x 45 mm [0.236 x 1.772"]
- Powder-actuated fasteners, shank diameter 4.5 mm [0.177"]
- Drilled holes, diameter 4.5 mm [0.177"]

The figures below show representative stress-strain curves for the tests (the plotted stress is based on the gross cross-section). Note that the line for the powder-actuated fasteners follows the control test line more closely than the lines for drilled holes or self-drilling screws.

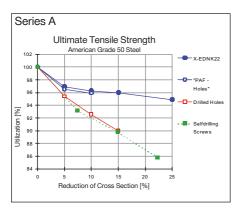

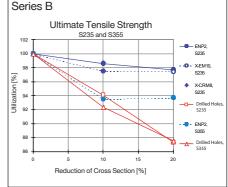

LOAD DEFORMATION SERIES A

LOAD DEFORMATION SERIES B

The test results were evaluated in terms of utilization as a measure of ultimate strength. Utilization is the ultimate load of a sample expressed as a percent of the ultimate load of the control test.

Graphs of the utilization versus cross-section reductions show that:

- The utilization for PAFs is clearly better than that of drilled holes or self-drilling screws.
- The hole left by a removed PAF has the same effect as when the PAF is left in place.
- Increasing the number of PAFs across a section from one to two or more has a proportionally smaller effect on utilization than placement of the first fastener.

More detailed information on the test program and findings is published in the paper

Powder-actuated fasteners in steel construction (and the referenced literature), published in the STAHLBAU-Kalender 2011 (Publisher Ernst & Sohn, 2011, ISBN 978-3-433-02955-8). English Reprints of the paper can be distributed per request.

# 5.7.2 Effect on the fatigue strength of structural steel

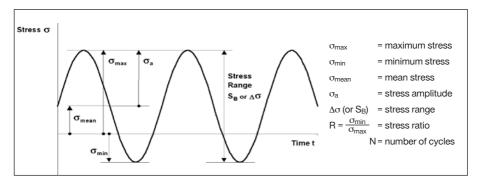

During the late 1970s and early 1980s, a fatigue testing program consisting of 58 tests with over 1,100 specimens was carried out at the University of Darmstadt in Germany. The reason for the research at that time was to support the use of powder-actuated fasteners for attaching noise-dampening cladding to railway bridges in Germany.

Parameters investigated in those tests are shown in following table:

| Steel grade    | Steel thicknesses     | Stress ratio R  | Imperfections                          |
|----------------|-----------------------|-----------------|--|
| S 235 (St 37)/ | 6, 10, 15, 20,        | 0.8, 0.5, 0.14, | Fastener:                              |
| A36            | 26.5, 40, 50 mm       | -1.0, -3.0      | - installed and pulled out,            |
| S 355 (St 52)/ | [0.236, 0.394, 0.591, |                 | - inclined installation and pulled out |
| grade 50       | 1.043, 1.575, 1.969"] |                 | - inclined installation                |

#### Loading conditions

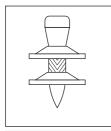

The terminology and notation is shown in the illustration below.

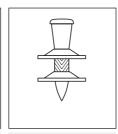

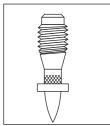

#### **Fasteners tested**

The primary fastener used in the tests was the Hilti ENP3-21 L15, the forerunner of the ENP2-21 L15. The difference is in the head shape, which has no effect on interaction with the base steel. Tests were also performed with the ENP2-21 L15, ENP3-21 D12 and the EM8-11-14 threaded stud, all of which have 4.5 mm diameter knurled shanks.

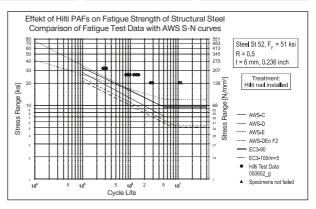

FNP3-21 I 15

ENP2-21 L15

ENP3-21 D12

EM8-11-14 P8

The results of the tests were evaluated by Niessner and Prof. T. Seeger from the University of Darmstadt in accordance with the provisions of Eurocode 3. An example plot of one test series is given at the right. The graph allows for a comparison with European fatigue categories 90 (m = 3) and 100 (m = 5) as well as American categories according to AWS-provisions.

#### Conclusions

- The effect of driving a Hilti powder-actuated fastener on the fatigue strength is well known and predictable.
- The constructional detail "Effect of powder-actuated fasteners on base material" (unalloyed carbon steel) was evaluated by Niessner and Seeger from the University of Darmstadt in compliance with Eurocode 3.
- The EC 3 detail category 90 with m = 3 or the detail category 100 with m = 5 is alternatively applicable.
- Wrong fastener installations as popped out or inclined fasteners are covered. Piston marks in the base material due to wrong use of the tool without a fastener or notches due to fasteners failed during the installation have to be removed by appropriate measures.

More detailed information on the evaluation of the test data and the test program is published in the paper "Fatigue strength of structural steel with powder-actuated fasteners according to Eurocode 3" by Niessner M. and Seeger T. (Stahlbau 68, 1999, issue 11, pp. 941-948).

English reprints of this paper can be distributed per request.

# 6. Concrete base material

#### 6.1 Anchoring mechanisms

The following three mechanisms cause a powder-actuated fastener to hold in concrete:

- · Bonding / sintering
- Keying
- Clamping

These mechanisms have been identified and studied by analyzing pull-out test data and by microscopic examination of pulled-out fasteners and the concrete to fastener interface.

# Bonding / sintering

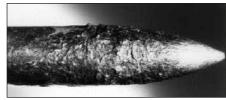

When driving a fastener into concrete, the concrete is compacted. The intense heat generated during driving causes concrete to be sintered onto the fastener. The strength of this sintered bond is actually greater than that of the clamping effect due to reactive forces of the concrete on the fastener. The existence of the sintered bond is demonstrated by examining pulled-out fasteners. The fastener surface, especially in the region of the point, is rough due to sintered-on concrete, which can only be removed by using a grinding tool. When performing pull-out tests, the most common failure mode is breakage of the sintered bond between the concrete and the fastener, especially at and near the point.

# Keying

The sintered material forms ridges on the fastener surface. These ridges result in a micro-interlocking of the fastener and the concrete.

This anchoring mechanism is studied by examining pulled-out fasteners under a microscope. As in the case of sintering, keying is primarily active in the region of the fastener point.

Mechanically cleaned point of a pulled-out DX fastener

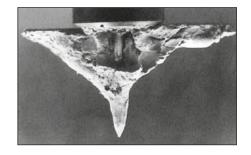

# Clamping

The compressibility of concrete limits the buildup of compressive stress around the driven fastener. This in turn limits the effectiveness of clamping as an anchoring mechanism.

The tendency of stressed concrete to relax further reduces the compressive stress and hence the clamping effect. For these reasons, clamping of the fastener shank contributes only insignificantly to the total pull-out strength.

#### Concrete failure

Concrete cone failure is occasionally observed when using a testing device with widely spaced supports. The fact that the concrete failed indicates that the fastener bond to the concrete was stronger than the concrete.

# 6.2 Factors influencing resistance to pull-out

Factors that can affect the pull-out strength of fastenings to concrete include:

- Depth of penetration into the concrete
- Concrete parameter (compressive strength, grain structure, direction of concrete placement)
- Distance to concrete edge and fastener spacing

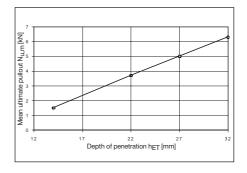

#### Depth of penetration het

Fasteners that are driven deeper typically have a higher resistance to pull-out. This relation is best shown by placing groups of fasteners with different driving energy and comparing the results for each group with the others. The result of such a test is shown in the graph at the right. Note that fastener driving failures were not considered in calculation of the average ultimate load,  $N_{\rm L.m.}$ 

The value of increasing the depth of penetration in order to increase pull-out strength is limited by the increasing fastener driving failure rate. Provided that the penetration depth is the same, fastenings in concrete with a higher compressive strength hold better than fastenings in lower strength concrete. The ability to exploit this

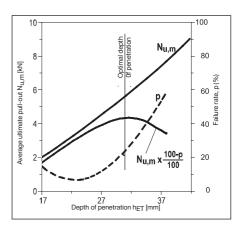

Pull-out strength and fastener driving failure rate both increase with increasing penetration depth. The optimum depth of penetration is taken as the depth at which the yield in terms of pull-out strength begins to decrease. This is within a range of 18–32 mm depending on the grade and age of the concrete as well as the strength of the fastener.

yield = 
$$N_{u,m} \cdot \left(\frac{100 - p}{100}\right)$$

characteristic is also limited by increased fastener driving failure rate with higher strength concrete.

As could be expected, the depth of penetration at which the failure rate is at a minimum decreases with increasing concrete strength.

# **Concrete parameters**

The concrete parameters (such as the type and size of concrete aggregates, type of cement and the location on top or bottom surface of a concrete floor) do affect the fastener driving failure rate, sometimes significantly.

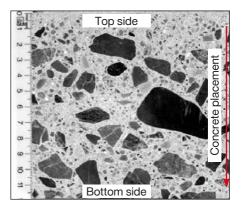

Fastener driving failures are caused by the fastener hitting a hard aggregate, such as granite, located close to the concrete surface. A hard aggregate can deflect the fastener and in a severe case, the fastener may bend excessively, shape and no hold being obtained by the fastener.
In case of slight fastener bending, concrete spalling may occur at the

leading to concrete fracture in a cone

In case of slight fastener bending, concrete spalling may occur at the surface. However, because pull-out strength is obtained mostly in the area of the fastener point, concrete spalling has little effect on the permissible load of the fastening.

Softer aggregates such as limestone, sandstone or marble may be completely penetrated when hit by the fastener.

Overhead fastening is usually associated with a higher rate of fastener driving failure than floor fastening. This is due to the distribution of the aggregates within the concrete. Large aggregates tend to accumulate at the bottom of a floor slab. At the top, there is a greater concentration of small aggregates and fines.

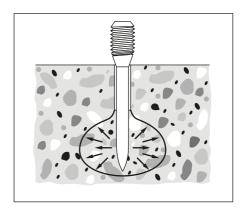

There are several possible ways of reducing the failure rate when powder-actuated fasteners are used for fastening to concrete. There are two basic ideas:

one is to reduce concrete tensile stresses near the surface and the other is to delay the effect of these stresses.

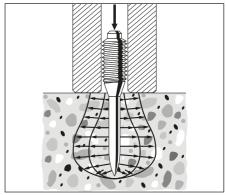

# Pre-drilling the concrete (DX-Kwik)

By pre-drilling a very small hole (5mm diameter, 18 or 23 mm deep), the stresses are relocated to greater depth in the concrete. Fasteners placed with DX-Kwik are surrounded by a stress "bulb" located deep in the concrete. With this method, virtually no fastener driving failures occur.

# Spall stop fastener guide

A spall stop is a heavy steel fastener guide. Its weight and inertia counteract the stresses at the surface for a very short time. This allows redistribution of the stresses to other parts of the concrete.

Changing from a long to a short fastener reduces the magnitude of the stresses and thus improves stick-rate.

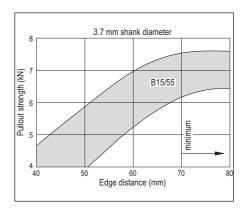

# Edge distance and fastener spacing

If fasteners are placed too close to the concrete edge, pull-out load capacity will be reduced. Minimum edge distances are therefore published with a view to reducing the effect edges have on pull-out strength. The corresponding data has been obtained from tests.

Additional provision is made for fastener spacing when positioned in pairs or where fasteners are placed in rows along a concrete edge.

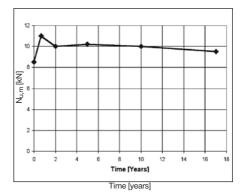

These edge distances and spacing also have the purpose of helping to prevent concrete spalling and/or cracking due to fastening. However, spalling has generally only an insignificant influence on pull-out strength.

# 6.3 Effect of time on pull-out resistance

The effect of age on pull-out strength has been investigated in comprehensive tests. The main concern is, in fact, the effect of concrete relaxation in the area around the driven fastener

This graph provides an overview of tests performed with DX-Kwik fasteners. Since standard DX fastenings have the same anchoring mechanism, this statement is also valid for standard DX fastenings. The test results indicate very strongly that relaxation of the concrete has no detrimental effect on the pull-out resistance of DX fastenings. The test data also shows that sintering and keying are the dominant anchorage mechanisms because they do not rely on friction between the fastener and the concrete.

# 6.4 Effect on concrete components

Fastenings in the compression zone of the structure have no effect on concrete compressive resistance as long as detailed provisions on edge distance and spacing are complied with.

Fastenings in the tensile zone are subject to the following provisions:

- a. Installations on plain load-bearing components such as concrete walls or ceilings are generally possible without restrictions as the load-bearing behaviour of these components is only negligibly affected by the fasteners. The predominant condition is static loading. This statement is based on experimental investigations carried out at the Technical University of Braunschweig, Germany.
- b. Fastenings in reinforced concrete beams:

If the concrete is too thin, concrete will spall off on the rear surface. The minimum thickness of concrete depends on the shank diameter of the fastener used.

- it has to be ensured that the main reinforcement steel will not be hit or penetrated by the DX fasteners. This measure of precaution is mainly founded on the reduction of the ultimate strain of the steel reinforcement. Exceptions are possible when the structural engineer responsible for design is consulted.
- c. Fastenings in pre-stressed concrete members:

it has to be ensured that the pre-stressing steel reinforcement or cables will not be hit or penetrated by the DX fasteners.

| Fastener shank | Minimum concrete |
|----------------|------------------|
| diameter       | thickness        |
| dnom (mm)      | hmin (mm)        |
| 3.0            | 60               |
| 3.5 / 3.7      | 80               |
| 4.5            | 100              |
| 5.2            | 100              |

# 7. Masonry base material

# 7.1 General suitability

Direct fastening technology can also be used on masonry. The joints between bricks or blocks and the covering plaster layer on virtually all types of masonry (exception for

lightweight aerated concrete blocks) provide an excellent substrate for light-duty and secondary fastenings.

| Suitability table: DX faste | ening on masonry  |  |   |  |

<sup>\*)</sup> Joints must be completely filled with mortar

The above table is based on laboratory and field experience. Because of the wide variety of types and forms of masonry in use worldwide, users are advised to carry out tests on site or on masonry of the type and form on which the fastenings are to be made.

# 8. Temperature effects on the fastening

#### 8.1 Effect of low temperatures on fasteners

Steel tends to become more brittle with decreasing temperature. Increased development of natural resources in Arctic regions has led to the introduction of steels that are less susceptible to brittle failure at subzero temperatures. Most siding and decking fasteners are used to fasten the liner sheets of an insulated structure and are not exposed to extremely low

temperatures during service. Examples of situations where the fastenings are exposed to extremely low temperatures during their service life are:

- Fastenings securing cladding in singleskin construction
- Construction sites left unfinished over a winter
- · Liner sheets in a cold-storage warehouse

# Low temperature embrittlement

The susceptibility of fasteners to become brittle at low temperatures can be shown by conducting impact bending tests over a chosen temperature range. The ability of Hilti drive pins to remain ductile over a temperature range from +20°C to -60°C is shown clearly by the fact that the impact energy required remains nearly constant throughout this temperature range.

# Impact bending test - DSH57 (4.5 mm diameter, HRC 58 $\pm$ 1)

| Temperature |     |     | Impact energy (foot-pounds) |         |       | Impact energy (Joules) |         |       |

Tests conducted according to DIN EN 10045 parts 1-4

Distance between supports = 22 mm

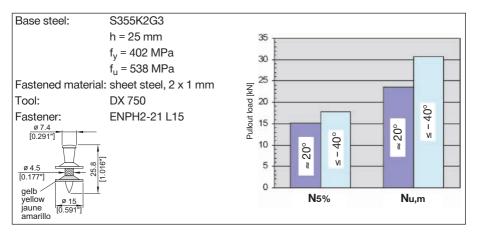

The symbol ">" indicates no breakage of the specimens. In the other cases, about 50% of the specimens suffered breakage.

## 8.2 Effect of low temperatures on fastenings to steel

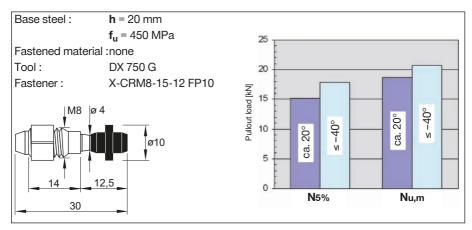

# Effect of low temperatures on pull-out strength

Tests show that very low temperatures tend to increase pull-out strength with both standard zinc-plated fasteners and with the stainless steel. The results of two tests are summarized below. The fasteners were

driven at room temperature and tested at -40°C to -70°C. A control sample was tested at 20°C. Explanations for the greater strength at low temperatures include increase in the strength of the zinc that is displaced into the knurling as well as increased strength of the fusing at the point of the fastener.

Two facts stand out from this testing:

- Pull-out strength increased as temperature decreased
- Pull-out from the base steel was the only mode of failure observed. There were no fractures!

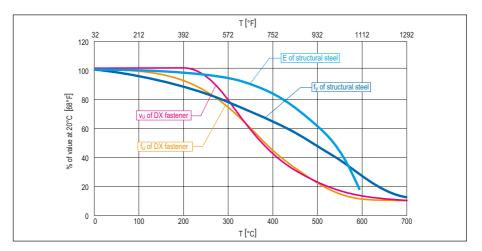

#### 8.3 Fire rating of fastenings to steel

# Standard zinc-plated, thermally hardened steel fasteners

When subjected to high temperatures as in a fire, both powder-actuated fasteners

and structural steel lose strength. Data for standard zinc-plated, thermally hardened fasteners and structural steel are plotted in the graph below.

Up to about 300°C [572°F], the strength loss for DX fasteners is roughly proportional to the yield strength loss of structural steel. At 600°C [1112°F], DX fasteners have about 12% of their 20°C [68°F] strength left and structural steel about 26%. Since DX fasteners obtain their high strength through a thermal hardening process, the loss in strength at elevated temperatures is proportionally greater than for structural steel.

The relevance of different strength losses has to be evaluated in the context of the proportion of the material strengths that are actually exploited in a design. In a design calculation, it is conceivable that some steel will actually reach yield stress.

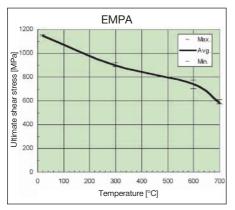

The material strengths of an X-ENP-19 L15 fastener is 30 kN [6.74 kips] in tension and 18.6 kN [4.18 kips] in shear respectively. The recommended working load in tension and shear for an X-ENP-19 L15 16 gauge (1.5 mm) fastening is 4.7 kN [1.057 kips] in tension and 4.6 kN [1.034 kips] in shear, respectively. Thus, the exploitation of the X-ENP-19 L15 strength at about 600°C is only 16 to 25% compared to about 74% for structural steel.

In a fire, powder-actuated fastenings will not be the governing factor. If the fire protection requirements permit the use of structural steel, then powder-actuated fastening can also be used without negative impact on fire protection.

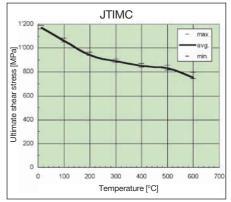

#### Temperature effects on the fastenings

CR500 stainless steel fasteners
Hilti X-CR/X-CRM fasteners are much
more resistant to loss of strength at high
temperatures than standard fasteners. The
effect of temperature on ultimate shear
stress of stainless fasteners made of CR500
was determined in single lap joint shear

In Japan, similar tests were carried out by JTICM (Japan). These tests were done by driving a 4.5 mm diameter X-CR nail through a 6 mm steel plate into a second 6 mm thick steel plate and shearing the two plates. From the graph it is apparent that the results are nearly the same.

tests by the Swiss Federal Laboratory for Materials Testing and Research (EMPA). The results are plotted in the diagram below. This test was done by shearing 4.5 mm diameter fasteners that were inserted in steel plates with 4.6 mm diameter drilled holes.

At 600°C, the CR500 material has 64% of its 20°C shear strength left. By comparison, standard fasteners have only 12% and structural steel only about 26%. The excellent fire resistance of the CR500 material alone justifies its use for some applications.

#### 8.4 Fire rating of fastenings to concrete

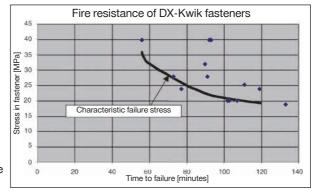

Concrete is weakened and damaged by fire but not as quickly as steel. In ISO-standard fire tests conducted with DX-Kwik fastenings at the Braunschweig Technical University in Germany the only failure mode was fracture of the nails.

The actual test data are shown in the table below:

| Tested<br>in crack width<br>ΔW (mm) | Tensile load,<br>F<br>(N) | Fire resistance/<br>time to failure<br>(minutes) | Failure mode    |
|-------------------------------------|---------------------------|--|-----------------|
| 0.2                                 | 250                       | 103  | Nail fracture   |
| 0.2                                 | 250                       | 107  | Nail fracture   |
| 0.2                                 | 350                       | 73   | Nail fracture   |
| 0.2                                 | 350                       | 91   | Nail fracture   |
| 0.2                                 | 500                       | 56   | Washer pullover |
| 0.2                                 | 500                       | 92   | Nail fracture   |
| 0.2                                 | 500                       | 93   | Nail fracture   |

The stress in the fasteners at failure was calculated and plotted so that a plot of stress versus time resulted.

The characteristic failure stress curve from the previous graph can be used to calculate the failure load for various shank diameters with exposure to fire of different lengths of time. The calculated failure loads for 3.7, 4.0 and 4.5 mm shank diameter fasteners after 60, 90 and 120 minutes exposure to fire are shown in the table below.

| Failure loads for various shank diameters and fire exposure times |                                       |            |             |  |  |
|---|---------------------------------------|------------|-------------|--|--|
| Shank   | Fire exposure time and failure stress |            |             |  |  |
| diameter  | 60 minutes                            | 90 minutes | 120 minutes |  |  |
| (mm)  | 32.1 MPa                              | 22.3 MPa   | 19.1 MPa    |  |  |
| 3.7   | 340 N                                 | 240 N      | 200 N       |  |  |
| 4.0   | 400 N                                 | 280 N      | 240 N       |  |  |
| 4.5   | 510 N                                 | 350 N      | 300 N       |  |  |

This table can be used to determine recommended loads for the ISO fire resistance required.

# 9. Design concepts

The recommended working loads N<sub>rec</sub> and V<sub>rec</sub> are suitable for use in typical working load designs. If a partial factor of safety design method is to be used, the N<sub>rec</sub> and V<sub>rec</sub> values are conservative when used as N<sub>Rd</sub> and V<sub>Rd</sub>. Alternatively, the design resistance may be calculated from the recommended loads by multiplying by the factor 1.4, which considers the uncertainties from the load on the fasteners. Exact values

for  $N_{Rd}$  and  $V_{Rd}$  can be determined by using the safety factors where given and or reviewing test data. Based on cyclic tests it can be stated that DX fastenings can be said to be robust, even when the actual loading turns out to be in part cyclic. Design loads (characteristic strength, design resistance and working loads) for the X-HVB shear connector are listed and specified per design quideline.

The designer may encounter two main fastening design concepts:

Working load concept

$$N_S \le N_{rec} = \frac{N_{Rk}}{\gamma_{GLOB}}$$

where  $\gamma_{\text{GLOB}}$  is an overall factor of safety including allowance for:

- · errors in estimation of load
- · deviations in material and workmanship

and  $N_S$  is in general a characteristic acting load.

$$N_S \cong N_{Sk}$$

Partial factors of safety

$$N_{Sk} \cdot \gamma_F = N_{Sd} \le \frac{N_{Rk}}{\gamma_M} = N_{Rd}$$

where:

 $\gamma_{\textbf{F}}$  is a partial factor of safety to allow for errors in estimation on the acting load and  $\gamma_{\textbf{M}}$  is a partial factor of safety to allow for deviations in material and workmanship.

The characteristic strength is defined as 5 % fractile:

$$N_{Rk} = N_{u,m} - k \cdot s$$

The k factor is a function of the sample size and the accuracy required. The characteristic strength of fastenings to concrete is determined based on a 90% probability while fastenings to steel are based on a 75% probability.

Structural analysis of the fastened part (e.g. roof deck panel or pipe hung from a number of fastenings) leads to calculation of the load acting on a single fastening, which is then compared to the recommended load

(or design value of the resistance) for the fastener. In spite of this single-point design concept, it is necessary to ensure adequate redundancy so that failure of a single fastening will not lead to collapse of the entire system. The old saying "one bolt is no bolt" can also be applied to DX fastening.

For standard DX fastenings on concrete, a probability-based design concept based on multiple fastening is applied in order to allow for fastener driving failures and the large scatter in holding power observed. This concept applies to tensile as well as shear loading and is described in following chapter.

# 10. Determination of technical data for fastening design

The determination of technical data is based on the following tests:

- Application limits
- Tensile tests to determine pull-out and pull-over strength
- Shear tests to determine bearing capacity of the attached material and the base material.

These tests are described in more detail in the sections "Steel and other metal base material" and "Concrete base material".

#### 10.1 Fastenings to steel

Failure loads in tension and in shear are normally distributed and the variation coefficient is <20%. The test data for each test condition are evaluated for the average and characteristic values. The characteristic value is based on the 5% fractile for a 75% probability.

The application range of the fastener is determined by application limit test where fasteners are set on steel plates of thickness ranging from the minimum recommended thickness  $t_{Il.min}$  to full steel ( $\geq$  20 mm) and varied plate strength.

The application limit is reached when 1 shear off failure with 30 fasteners tested occurs, or if a detrimental effect on the load values (resistance) occurs.

Due to the small scatter in failure loads fastenings in steel can thus be designed as single points, although good engineering practice should be kept in mind. System redundancy must be always ensured.

#### 10.2 Profile sheet fastenings

In addition to general fastenings to steel, specific data applies to profile sheet fastenings:

#### Cyclic loading

Profile sheet fastenings are subjected to repeated loading to simulate wind effects. Cyclic pull-through tests are additional optional tests where the failure load at 5,000 cycles is determined.

The design value of the pull-through resistance for repeated wind loads is the design value of the static pull-through resistance multiplied by a reduction factor of  $\alpha_{\text{CVCl}}$ .

• If cyclic tests are carried out:

 $\alpha_{cvcl} = 1.5 (N_{Rk,cvcl}/N_{Rk,sta}) \le 1$ 

(The factor 1.5 takes the different safety levels for fatigue and predominately static design into account)

• If no cyclic tests are carried out:

$$\alpha_{\text{cycl}}$$
 = 0.5

#### Sheet bearing capacity

Profile sheet fastenings may be subjected to shear stresses from building movements or thermal dilatation of the sheets. Tests are undertaken to prove the suitability of the fastenings to support the deformations imposed.

For this, shear tests are carried out using a substrate of the minimum and maximum thickness and 2 layers of profile sheet of the thickness specified.

The fastening is considered suitable if an elongation of 2 mm is achieved without the sheet coming loose or showing an excessive reduction in pull-out load capacity. In this case, no consideration of forces of constraint is required since sufficient ductility is provided by the fastening due to hole elongation.

#### Standardization

The pull-over strength of profiled sheet fastenings is given with reference to core sheet thickness. Ultimate load data is standardized to the minimum sheet thickness and strength as specified by the relevant sheet standard. The correction applied is as follows:

$$\mathbf{F_{u'}} = \mathbf{F_{u}} \cdot \frac{t_{min}}{t_{act}} \cdot \frac{f_{u,min}}{f_{u,act}}$$

#### 10.3 Fastenings to concrete (standard DX / GX / BX)

The failure loads in tension and shear show a large scatter with a variation coefficient of up to 60%. For specific applications, fastener driving failures may be detected and the fasteners replaced (e.g. threaded studs). For others, however, detection may not be possible (e.g. when fastening wooden battens) and this must be taken into consideration.

The design resistance is therefore determined for:

- failure loads without considering fastener driving failures
- failure loads considering a 20% rate of fastener driving failure

Evaluation of technical data and design according to the single point design approach based on fractiles and a safety factor is not feasible for such systems. The characteristic value would become zero at a variation coefficient of about 50%.

The evaluation of the data and the determination of the design resistance is therefore based on a multiple fastening, i.e. a redundant design, in which the failure probability not of a single, but of a number of fasteners supporting a structure is calculated. By this system, load may be transferred between the fasteners, if slip or failure of one or more of the fasteners occurs.

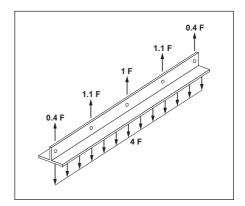

#### Test data

The test data for the fastener is consolidated to form a master pullout load distribution.

#### Static system

Two static systems are examined

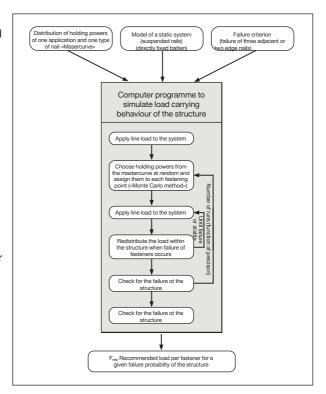

- A suspended beam allowing unrestrained flexure of the beam
- A beam directly attached to the surface, which shows restrained flexure

#### Calculation method

The calculation method used is the Monte Carlo method. by which holding values taken stochastically from the master distribution are attributed to the individual fasteners of the system and the system is checked to determine whether the imposed line load can be supported. By performing a large number of such simulations, statistical information on the failure probability of a system under a given line load is obtained. Hidden setting failures can also be considered with this method.

#### **Design parameters**

The design is based on the following parameters:

• Failure probability: 1 · 10<sup>-6</sup>

Number of fasteners:Line load uniformly distributed

• Failure criterion: 2 edge or 3 central fastenings

The result is expressed in recommended load per fastening.

#### Effect on a fastening design

The overall condition for a fastening design in practice is that redundancy of the complete system has to be ensured. The effect of the Monte Carlo approach on a design is illustrated with two examples below.

#### **Example:**

Fastening of a plumbing with five ceiling hangers.

- Due to the stiffness (EI) of the plumbing a redistribution of the dead load (g) to the remaining hangers is given in case of two neighbouring hangers failing.
  - ( Fixing of each hanger with one nail is sufficient.
- The plumbing is not stiff enough to redistribute the dead load to the neighbouring hangers in case of one fastener failing.
  - (Each hanger has to be fastened with five nails.

# 

#### 10.4 DX fastenings to concrete (DX-Kwik)

Failure loads in tension and shear are log-normally distributed and the variation coefficient is <20%. The test data is evaluated to yield the 5% fractile based on a 90% probability. The recommended working loads are obtained by applying a global safety factor of 3 for tension and shear.

The determination of technical data for cracked concrete (tensile zone) is based on tensile tests. Shear tests in cracked and uncracked concrete give similar results and are therefore not performed.

Failure loads in cracked concrete show a higher variation coefficient. Test data is also evaluated to yield the 5% fractile. The recommended load for the tensile zone is taken as the smaller of the following values:

- $N_{rec} = N_{Rk}/\gamma_{GLOB}$   $\gamma_{GLOB} = 3.0$  for 0.2 mm crack width
- N<sub>rec</sub> = N<sub>Rk</sub>/ $\gamma$ <sub>GLOB</sub>  $\gamma$ <sub>GLOB</sub> = 1.5 for 0.4 mm crack width.

The application range of the fastener is determined by application limit test where fastenings are made on concrete of varying strength and age according to the application conditions specified (pre-drilling and setting). The attachment height is kept at the lower end of the range specified. The application limit is reached, if the failure rate exceeds 3% or the pull-out values strongly deviate from a lognormal distribution. The sample size is 30 per condition.

#### 10.5 Fastener design in the USA and Canada

Testing of powder-actuated fasteners is carried out according to the ICC-ES AC 70 acceptance criteria and ASTM E 1190 standard test method. The test procedure covers tensile and shear testing in steel, concrete and masonry.

The determination of the allowable (recommended) load is shown below. The recommended working load is derived from the test data by taking the average failure load or the calculated characteristic load divided by a global safety factor.

$$P_{a}=V_{a}=F_{all}=\frac{F\cdot R\cdot R_{f}}{\Omega} \tag{3-1}$$

where:

F = Average ultimate load [lbf (N)] of the test series.

 $\Omega$  = Safety factor determined in accordance with Section 3.3.2.

R = Most severe base material reduction factor determined in accordance with Section 3.3.3.1, 3.3.3.2, or 3.3.3.3, as applicable.

 $R_f$  = Fastener based reduction factor, determined in accordance with Section 3.3.3.4, as applicable.

**Exception:** When testing satisfies the alternate sample size described in Section 8.1 of ASTM E1190 (the COV from ten tests is 15 percent or greater), F shall be taken as the lowest ultimate load of the ten tests and  $\Omega$  shall be taken as 5.

**3.3.2** Safety Factor,  $\Omega$ : The safety factor shall be determined using Equation 3-2.

$$\Omega = \frac{3.5}{(1 - 2COV)} \ge 5 \tag{3-2}$$

Part 2:

# Fastener selection guide

#### 1. Selecting the right fastener

These considerations are used to determine suitable powder-actuated (DX), gas-actuated (GX) or battery-actuated (BX) fasteners for a given application.

Detailed technical information for the selected fastener family can be found on its product data sheet on the displayed pages.

For some applications, two or more fastener families are listed as suitable. The final selection is influenced by specific application requirements, available tools and technical data can be found on the product sheets.

Regional differences in building methods, materials, trade preferences, available tools, etc. also influence fastener selection. Therefore, designers and specifiers are advised to consult the local Hilti website and make use of the local Hilti technical advisory service.

#### 1.1 Selection based on the type of concrete

#### What determines nail performance

Hilti Direct Fastening systems are designed to achieve maximum performance in a wide range of applications. But there is a large variety of nails types and elements for various direct fastening concrete applications. To select the appropriate nail for a given application, some important influencing parameters need to be considered:

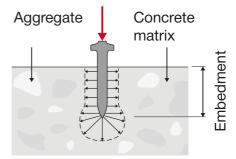

- a) concrete properties,
- b) nail design and features
- c) fastening system used
- d) nail embedment depth
- e) fastening tools and energy level

#### a) Concrete properties

A nail penetrating concrete needs to create a hole for the shank by crushing and compacting the concrete and also needs to withstand hitting hard aggregates. The resulting holding value achieved by the nail is linked to its diameter and embedment depth.

High penetrability and compactability lead to high stick rates and holding values.

Note: Concrete compressive strength alone is not decisive for nail performance.

#### Four concrete types can be roughly distinguished:

. Compressive strength class C12/15 acc. to EN 206

• Medium compressive strength,  $f_{c, \text{ cube}} \approx 25 \div 45 \text{ MPa}$ · Average hard and small to medium size aggregates

Example:

· Normal weight concrete for interior floor slabs

• Compressive strength class C20/25 acc. to EN 206

• Medium to high compressive strength,  $f_{c, \text{ cube}} \approx 45 \div 65 \text{ MPa}$ · Average hard and medium size aggregates, e.g. limestone, pit gravel, some granite Tough

Example: · Normal weight concrete in historic buildings

• Compressive strength class C50/60 acc. to EN 206

tough

Medium

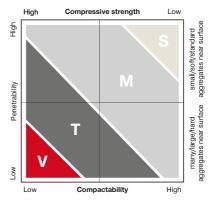

· Hard and medium size aggregates, e.g. quartz, basalt, greywacke

Example:

· Ultra-high-performance concrete

Compressive strength class C70/80 acc. to EN 206

Note: f<sub>c. cube</sub> = compressive strength of concrete cube (150 mm edge length)

#### b) Nail design and features

Penetrability and compactability, i.e. a nail's ability to penetrate and compact the concrete, are strongly influenced by three nail design features:

#### Point type

The point type and the reduction of the diameter in the area of the tip allows a significantly improved penetration behaviour in concrete.

#### Nail geometry

Length and diameter also affect how easily the nail penetrates the concrete.

#### Nail hardness

A harder nail is easier to drive into tougher concrete. However, if the nail is too hard, it can break instead of bending when it hits a hard aggregate in the concrete.

#### c) Fastening systems used

Hilti Direct Fastening Systems help to ensure that nails are correctly driven by achieving maximum nail perpendicularity, good nail guidance and thorough use of the appropriate driving energy.

#### Perpendicularity

Hilti Direct Fastening tools help to keep nails perpendicular to the working surface, thus reducing failures caused by nails driven at an angle. During the fastening process, Hilti Direct Fastening tools have be maintained perpendicular to base material as much as possible. Please refer the respective instructions for use and tool operation manuals for details.

#### Nail guidance

Due to excellent nail guidance in the tool and the use of solid washers, the nail leaves the tool at the intended angle.

#### d) Nail embedment depth

Another factor that influences nail performance is embedment depth. A nail that can be driven deeper in the concrete has the ability to achieve higher load performance. However, there are two side effects if a nail needs to be driven deeper.

- stick rate can decrease
- higher driving energy is required as the nail must penetrate further into the concrete

#### e) Fastening tools and energy levels

Nail driving energy released by a Hilti tool is precisely controlled to help achieve the desired embedment depth reliably.

#### Powder-actuated tools (DX)

Embedment depth of a nail can be influenced by selecting the right cartridge color and adjusting the power setting on the tool, where applicable.

Hence, it is crucial to understand how the different tools in combination with the various cartridges, vary in terms of energy generation. Use that knowledge to pick the right tool and the right cartridge to help achieve the required embedment depth and reach the optimum nail load performance.

#### Gas-actuated tools (GX)

Embedment depth can be influenced by adjusting the slider in the front of the tool to "+" or "-" position.

#### Battery-actuated tools (BX)

Embedment depth can be influenced by selecting a different nail length.

#### Choice of a nail for use on concrete

Three main factors define the nail selection on concrete:

- · speed of installation
- stick rate
- holding values

#### Speed of installation

All system technologies, powder-actuated tool (DX), gas-actuated tool (GX) and battery-actuated tool (BX) offer a very high installation speed.

#### Stick rate

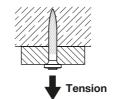

The stick rate indicates the percentage of nails that are driven correctly to carry a load.

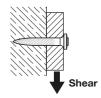

Generally, stick rate can often be improved by combination of:

- using shorter nails (on condition that required load can still be achieved with shorter embedment)
- selecting nails from a higher nail class (nail classes are described later in this chapter)
- using more energy by combination of tools, cartridges and energy setting
- using different technologies and nails from a higher nail class, i.e. switching from gas-actuated (GX) or battery-actuated tools (BX) to powder-actuated tools (DX)
- · pre-drilling, see chapter Kwik

#### Holding values

Holding values provide a measure of a nail's load-bearing capacity which ensures the reliable use in practical applications, consistent with their diameter and embedment depth. Nails are typically subject to static or quasi-static loads, which act as tensile, shear or combined tensile and shear forces.

#### Nail types

Different nails have been developed for various applications and conditions.

Medium duty Class I and II nails are used for load-sensitive high performance applications in tough concrete, while medium duty Class III nails are for versatile use in soft, medium and tough concrete. Medium duty Class I, II and III nails are generally fastened with powder-actuated tools (DX).

Light duty Class IV and V nails, generally fastened with gas-actuated (GX) and battery actuated tools (BX), are typically used for applications that have lower load requirements, hence requiring shorter embedment depth. In general, Class V nails present the most economical solution as they are the least costly.

Cost is directly related to the manufacturing technologies involved as well as the material from which the nails are made.

Under harsher conditions, each nail class performs better than the one below, and the manufacturing costs, and thus the price of the nail, increase with each nail class.

|            |             |                  | Nail featured |                             |                     |                             |  |                                     |

<sup>1)</sup> X-AL-H nail is pre-mounted to X-CX ceiling fasteners

#### Nail class versus concrete type

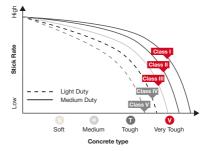

# Stick rate versus holding values of nail classes

Nail classes are clearly differentiated when faced with tough concrete. Depth of embedment, nail geometry, hardness and tip shape vary between nail classes.

# Stick rate of nail classes in different concrete types

Nail performance varies depending on the toughness of the concrete and the distribution of its aggregates. Nails of all classes perform similarly in soft concrete, but as the concrete gets tougher, the stick rate varies.

#### Select the right nail for concrete

Here are four simple steps to help guide you to the right nail

- 1. Understand the application
- 2. Be specific about important application requirements
- 3. Get to know the Hilti range of nails
- 4. Then choose the right nail based on application requirements

Following these four steps will help you:

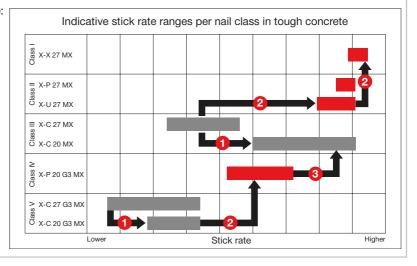

- · Maximize the stick rate.
- Achieve the required holding values.
- Select the most cost-efficient nail.
- Achieve optimum embedment depth based on selecting the appropriate cartridge and adjusting the power setting.

Improving the stick rate can be done in three different ways:

- 1. Use a shorter nail (if required embedment / load still can be reached with shorter nail)
- 2. Select a nail from a higher nail class (move from Nail Class III to II)
- 3. Use more energy (energy setting) / select different technology

#### Example:

- no power and cartridge selection required for GX and BX systems.
- Important: other application relevant requirements, e.g. environmental conditions, corrosion resistance, etc., must be considered.

#### 1.2 Selection based on environmental conditions

Corrosion may have a major influence on the suitability of a fastener for an application and therefore also on fastener selection. In order to provide a basis for judging the suitability of fasteners, it is useful to categorise applications in three classes:

- Non-safety relevant, temporary fastenings (e.g. fastenings of wooden kickers in concrete formwork)
- Non-safety relevant, permanent fastenings (e.g. metal track fastenings for drywall)
- Safety relevant, permanent fastenings (e.g. profiled metal sheet fastenings in roof and walls)

**Non-safety-relevant**, **temporary** and **permanent** fastenings: zinc-plated fasteners made of normal carbon steel can be used without restriction. Corrosion and related damages can, however, reduce the capacity of fasteners.

Safety-relevant, permanent fastenings: the restrictions described below apply:

- In any case where there is a restriction to use galvanized carbon steel fasteners if they are exposed to weather or if they are inside and subject to repeated wetting as from condensation. The galvanization (typically in a range from 5 to 20 microns of Zn) provides corrosion protection during transport and construction, during which exposure to weather can never be completely prevented. If the fastenings are exposed to repeated wetting or weather during their service life, the use of galvanized carbon steel fasteners is prohibited and stainless steel fasteners must be used. This safety measure must be observed without exception because the corrosion of galvanized steel fasteners leads not just to material loss but also to hydrogen embrittlement. Hydrogen embrittlement can easily result in fracture of the fastener at very low load.
- Referring to the above-mentioned example of profiled metal sheet fastening for roofs and walls, the use of galvanized steel fasteners is allowable only where wetting of the fastener is not to be expected. This applies in general to inside skins of two skin, insulated roofs and walls enclosing dry and closed rooms. This is the classic application area for X-ENP19 galvanized fasteners.
- For special applications like swimming pools or tunnels, highly corrosion-resistant resistant stainless steel materials are recommended. See also Part 4, Chapter 4.
   Please consult Hillti in such cases

**Contact corrosion** is taken into consideration by observing common rules concerning acceptable material combinations. Parts made of less noble metals are subject to increased corrosion if they are in electrochemical contact with a larger part made of a more noble metal, provided of course that an electrolyte is present. Fasteners that are used in wet areas must be at least as noble or better nobler than the fastened part. The effect of contact corrosion is shown in the table below. This information is especially applicable to stainless steel fasteners, like X-CR, X-ST-GR and X-R, because these are suitable for safety-relevant, permanent application in outdoor areas or areas otherwise exposed to corrosion.

|                               | Power-actuated fastener  |                 |
|-------------------------------|--------------------------|-----------------|
| Fastened material             | Zinc-plated carbon steel | Stainless steel |
| Construction steel (uncoated) | S                        | S               |
| Galvanized steel sheet        | S                        | S               |
| Aluminum alloy                | d                        | s               |
| Stainless steel sheet         | d                        | S               |

s = Negligible or no corrosion of fastener, d = Heavy corrosion of fastener

Accelerated corrosion of a fastener due to contact corrosion can take place only in the presence of an electrolyte (moisture from precipitation or condensation). Without this electrolyte – e.g. in dry inside rooms – zinc-plated fasteners can be used in connection with more noble metals.

#### 2. Design concepts

The recommended working loads ( $N_{rec}$  and  $V_{rec}$ ) are suitable for use in typical working load designs. If a partial safety factor design method is to be used, the  $N_{rec}$  and  $V_{rec}$  values are conservative when used as  $N_{Rd}$  and  $V_{Rd}$ . Exact values for  $N_{Rd}$  and  $V_{Rd}$  can be determined by using the safety factors where given and/or by reviewing test data. Design loads (characteristic strength, design resistance and working loads) for the X-HVB shear connector are listed as per design guideline.

Worldwide the designer may encounter two main fastening design concepts:

Working load concept

$$N_S \le N_{rec} = \frac{N_{Rk}}{\gamma_{GLOB}}$$

where  $\gamma_{GLOB}$  is an overall factor of safety including allowance for:

- · errors in estimation of load
- · deviations in material and workmanship

and  $N_S$  is, in general a characteristic acting load.

 $N_S \cong N_{Sk}$ 

Partial factors of safety

$$N_{Sk} \cdot \gamma_F = N_{Sd} \leq \frac{N_{Rk}}{\gamma_M} = N_{Rd}$$

where:

 $\gamma_F$  is a partial factor of safety to allow for errors in estimation on the acting load.  $\gamma_M$  is a partial factor of safety to allow for deviations in material and workmanship.

Structural analysis of the fastened part (e.g. roof deck panel or pipe hung from a number of fastenings) leads to calculation of the load acting on a single fastening, which is then compared to the recommended load (or design value of the resistance) for the fastener. In spite of this single point design concept, it is necessary to ensure that there is sufficient redundancy that the failure of a single fastening will not lead to collapse of the entire system. The old saying "one bolt is no bolt" applies also to Direct fastening.

# 3. Nomenclature/symbols

Following is a table of symbols and nomenclature used in the technical data.

| and performance  |  |  |
|--|--|--|
| Tensile and shear forces in a general sense.   |  |  |
| Combined force (resulting from N and V) in a general sense.  |  |  |
| Tensile and shear forces acting on a fastening in a design calculation.  |  |  |
| Combined force (resulting from N <sub>s</sub> and V <sub>s</sub> ) in a design calculation.  |  |  |
| Ultimate tensile and shear forces that cause failure of the fastening;   |  |  |
| statistically, the reading for one specimen.   |  |  |
| Average ultimate tensile and shear forces that cause failure of the  |  |  |
| fastening, statistically, the average for a sample of several specimens.   |  |  |
| The standard deviation of the sample.  |  |  |
| Characteristic tensile and shear resistance of test data, statistically,   |  |  |
| the 5 % fractile.  |  |  |
| Characteristic tensile and shear resistance of the fastening used for  |  |  |
| fastening design; statistically, the 5 % fractile. For example, the  |  |  |
| characteristic strength of a fastening whose ultimate strength can be  |  |  |
| described by a standard Gauss type distribution is calculated by:  |  |  |
| $N_{Rk} = N_{u,m} - k \cdot S$ where k is a function of the sample   |  |  |
| size n and the desired confidence  |  |  |
| interval.  |  |  |
| Tensile and shear design resistance of the fastening   |  |  |
| $N_{Rd} = \frac{N_{Rk}}{\gamma_M} \ \ \text{and} \ V_{Rd} = \frac{V_{Rk}}{\gamma_M} \ \ \text{where} \ \gamma_M \ \text{is a partial safety factor for} \\ \text{the resistance of the fastening.}$  |  |  |
| Recommended tensile and shear force of the fastening   |  |  |
| $N_{rec} = \frac{N_{Rk}}{\gamma_{GLOB}} \text{ and } V_{rec} = \frac{V_{Rk}}{\gamma_{GLOB}} \text{ where } \gamma_{GLOB} \text{ is an overall factor of safety.}$  |  |  |
| Recommended working moment on the fastener shank   |  |  |
| $M_{rec} = \frac{M_{Rk}}{\gamma_{GLOB}} \qquad \qquad \text{where $M_{RK}$ is the characteristic} \\ \text{moment resistance of the fastener} \\ \text{shank and $\gamma_{GLOB}$ is an overall factor} \\ \text{of safety. Unless otherwise stated on} \\ \text{the product data sheets, the $M_{rec}$} \\ \text{values in this manual include a safety} \\ \text{factor of "2" for static loading.} \\$ |  |  |
|  |  |  |

| Fastening de     | etails  |
|------------------|---|
| h <sub>ET</sub>  | Penetration of the fastener point below the surface of the base material.   |
| h <sub>NVS</sub> | Nail head standoff above the surface fastened into (with nails, this is the |
|                  | surface of the fastened material, with threaded studs, the surface of the   |
|                  | base material).   |
| t <sub>II</sub>  | Thickness of the base material.   |
| t <sub>l</sub>   | Thickness of the fastened material.   |
| $\Sigma t_{l}$   | Total thickness of the fastened material (where more than one layer is      |
|                  | fastened).  |
|                  |   |
| Characteristi    | cs of steel and other metals  |
| f <sub>V</sub>   | Yield strength of steel.  |
| f <sub>u</sub>   | Tensile strength of steel.  |
|                  |   |
| Characteristi    | cs of concrete and masonry  |

|                       | •   |
|-----------------------|---|
| f <sub>C</sub>        | Compressive strength of cylinder (150 mm diameter, 300 mm height).  |
| $f_{cc}$              | Compressive strength of cube (150 mm edge length).                  |
| $f_{c,100}/f_{c,200}$ | Compressive strength of 100 mm diameter cylinder / cube with 200 mm |
|                       | edge length.  |
|                       |   |

Approvals, technical assessments and design guidelines are given on the product information sheets as abbreviations of the names of the issuing institutes or agencies. Following is a list of abbreviations:

| Abbreviation | Name of institute or agency / description                 | Country         |
|--------------|---|-----------------|
| FM           | Factory Mutual (insurers' technical service)              | USA             |
| UL           | Underwriters Laboratories (insurers' technical service)   | USA             |

# 4. Tips for users

# Tips for users ("Trouble Shooting")

#### DX fastenings on concrete

<sup>\*)</sup> Rule of thumb: The higher the compressive strength of concrete, the shorter the fastener **Proper length (mm):** L<sub>s</sub> = 22 + t<sub>1</sub> (compare, "Fastening Technology Manual" Part Product section)

#### DX fastenings on concrete

#### Observation

#### Cause

#### Possible remedial measures

# Nail is bending

- Hard and/or large aggregate in concrete
- · Rebar close to surface of concrete
- Hard surface (steel)
- Use shorter nail
- Use DX-Kwik (predrill)
- Use stepped shank nail X-U 15
- Change cartridge

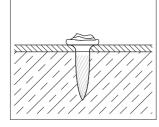

#### Base material is spalling

- High strength concrete
- Hard and/or large aggregate in concrete
- Old concrete

- Stud application: Use spall stop X-460-F8SS / - F10SS
- Nail application: Use shorter nail Use DX-Kwik (predrill) Use X-U 15 (for highstrength precast concrete)

#### Damaged nail head

- Too much driving power
- Wrong piston used
- Damaged piston
- Reduce power setting
- Use lighter cartridge
- Check nail-pistoncombination
- Change piston

Wrong pistons can cause all the above faults: match pistons to nails! **Fastener** 

X-U, X-C, X-P

Piston

Piston tip

Use piston X-460-P8

#### DX fastenings on steel

#### Observation

# Nail does not penetrate surface

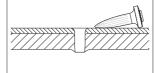

#### Cause

- Too little driving power
- Application limit exceeded (very hard surface)
- Unsuitable system

#### Possible remedial measures

- Try higher power setting or heavier cartridge
- Short nail application: Try X-U 15
- Long nail application: Try X-U
- Use co-acting principle/ fastener guide
- Switch to heavy system like DX 76 PTR

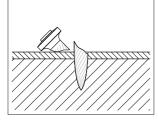

# Nail does not hold in base material

 Excess driving energy in thin steel base material (3 to 4 mm steel)

- Try different power setting or different cartridge
- Try X-ENP2K or X-EDNK22 THQ 12 for fastening sheet metal

#### Nail is breaking

- Too little driving power
- Application limit exceeded (very hard surface)
- Try higher power setting or heavier cartridge
- Use shorter nail
- Use X-ENP19
- Use stronger nail (X-...-H)
- Use stepped shank nail: X-U 15

#### DX fastenings on steel

# Observation Cause Possible remedial measures • Too much driving power Reduce power setting Nail head penetrates • Use lighter cartridge through material fastened • Use nail with Top Hat (metal sheet) • Use nail with washer e.g. X-U ...S12 • Too much driving power Reduce power setting Damaged nail head • Use lighter cartridge Check nail-piston-• Wrong piston used combination Worn-out piston Change piston

| Wrong pistons can cause all the above faults: match pistons to nails! |                     |            |  |  |
|---|---------------------|------------|--|--|
| Fastener  | Piston              | Piston tip |  |  |
| X-U, X-P, X-S   | Use piston X-460-P8 |            |  |  |

Part 4:

# **Fasteners**

# X-ENP Siding and decking nail

# **Product data**

# Dimensions Ø 7.4 Ø 2.5 Ø 4.5 Ø 15

# Material specifications

Carbon steel shank: HRC 58
Zinc coating: 8–16 µm

# Recommended fastening tools

Tools: Single nail: DX 76 F15, DX 76 PTR with X-ENP-19 L15

X-76-F15-PTR fastener guide

Tools: Collated nails:

DX 76 MX, DX 76 PTR X-ENP-19 L15 MX,

white magazine strip
DX 860-ENP, DX 9-ENP X-ENP-19 L15 MXR,

grey magazine strip

 For more details, please refer to the chapter
 Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

# Approvals and certificates

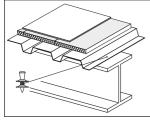

ETA-04/0101 (Hilti-DX-DoP001), UL R13203, FM 3021719, ICC ESR-2197, ESR-2776 (USA), MLIT (Japan), ABS, LR 97/00077

 Not all information presented in this product data sheet might be subject to approval/ certificate content. Please refer to approval/certificate for further information.

# **Applications**

# Examples

Roof decking

Floor decking

Wall liners

The intended use only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres. For out-door applications, that can be ensured by using SDK2 sealing caps. During construction exposure to external atmosphere must not exceed 6 months. Fastening of aluminum sheeting is generally recommended only for indoor conditions.

| 1.50  | 1.85                                       | 1.45                             |  |  |
| 2.00  | 2.55                                       | 1.90                             |  |  |

- 1) Only recommended for indoor applications. Constraint forces and corrosion aspects have to be considered.
- For intermediate sheet thicknesses, use recommended load for next smaller thickness.
- Recommended loads N<sub>rec</sub> and V<sub>rec</sub> are appropriate for Eurocode 1 wind loading design with a partial safety factor of γ<sub>F</sub> =1.5 for wind load and a partial resistance factor γ<sub>M</sub> = 1.25 for the fastening.

# Recommended loads - other applications

| V <sub>rec</sub> [kN] | N <sub>rec</sub> [kN] |
|-----------------------|-----------------------|
| 4.6                   | 2.4                   |

- <u>Fastened parts</u>: clips, brackets, etc.; thick steel parts (t<sub>l.max</sub> = 2.5 mm).
- · Redundancy (multiple fastening) must be provided.
- · The possibility of prying effects has to be considered
- Failure of the fastened part is not considered in these values of N<sub>rec</sub>, V<sub>rec</sub>.
- · Valid for predominantly static loading
- Global factor of safety is ≥ 2 based on 5% fractile value

#### Design

Depending on the verification concept, the corresponding design criteria are given as following.

| Working load c | oncept               | Partia            | al safe         | ty concept |  |
|----------------|----------------------|-------------------|-----------------|------------|--|
| Tensile loads  | $N_{Sk} \le N_{rec}$ | N <sub>Sd</sub> ≤ | $N_{\text{Rd}}$ |            |  |
| Shear loads    | $V_{Sk} \le V_{rec}$ | V <sub>Sd</sub> ≤ | $V_{Rd}$        |            |  |

# N-V Interaction

For combined tensile and shear forces on the fastener, a linear function has to be used.

# **Application recommendation**

# Thickness of base material

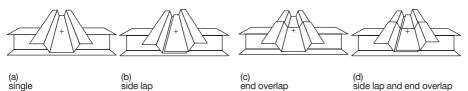

# Steel thickness t<sub>II</sub>

# Thickness of fastened material

# $\Sigma t_{l, tot} \le 4.0 \text{ mm}$

# Sheet thicknesses and overlap types

| Nominal sheeting thickness t <sub>I</sub> | Allowable overlap types |
|---|-------------------------|
| 0.63-1.00 mm                              | a, b, c, d              |
| > 1.00–1.25 mm                            | a, c                    |
| > 1.25–2.50 mm                            | a                       |

With the above recommended sheet thickness and overlap types, it is not necessary to take into account the effect of constraints due to temperature for steel grades up to S320 (EN 10346). For steel grade S350 (EN 10346) it shall be considered for design. Sheets of grade S350 on base material  $t_{||} \ge 8$  mm have been verified by Hilti, forces of constraint can be neglected.

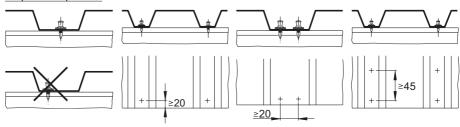

# Spacing and edge distances (mm)

# Steel base material

# Trapezoidal profiles

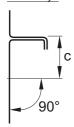

Centre fastenings in ribs

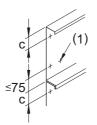

Clearance to end of sheet

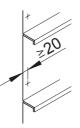

Double fastenings (asymmetric)

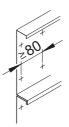

Note: Reduce tensile resistance per fastener to 0.7  $N_{Rk}$  or 0.7  $N_{rec}$ .

# Liner trays

Clearance to side of sheet Clearance to side of sheet Clearance to end of sheet

Fastener spacing along sheet

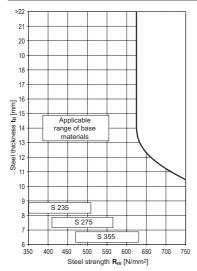

When driving the fastener, the fastening tool needs to be positioned perpendicular to the surface. If c > 75 mm, it is recommended to drive an additional fastener at the other side of the tray. This additional fastener is indicated with (1) in the graph above.

# Application limit

# X-ENP-19 with DX 76, DX 76 PTR, DX 860-ENP and DX 9-ENP

# **Corrosion information**

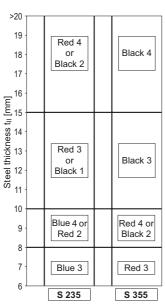

- The intended use only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres.
- For outdoor applications that can be ensured by using SDK2 sealing caps.
- During construction exposure to external atmosphere must not exceed 6 months.
- Fastening of aluminum sheeting is generally recommended only for indoor conditions.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

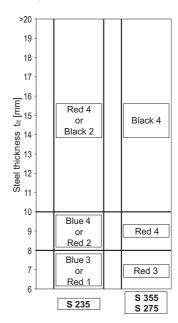

| Fastener progra | Fastener program and system recommendation |          |                                  |                |  |  |  |

# Cartridge selection and tool energy setting

# DX 76, DX 860-ENP, DX 9-ENP

# DX 76 PTR

Fine adjustment by installation tests on site.

# Note for S275:

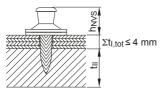

Start with recommendation for S355. In case of too much energy: reduction of tool energy setting or change of cartridge colour till correct nail head stand-offs  $h_{NVS}$  are achieved.

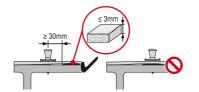

# **Quality assurance**

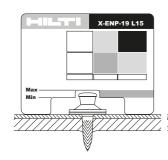

# Fastening inspection

 $h_{NVS} = 8.2-9.8 \text{ mm for } t_{l.tot} \le 4 \text{ mm}$ 

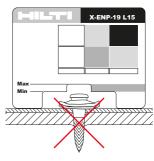

In order to allow the steel sheeting to be in direct contact with the steel supporting structure in the area of connections the X-ENP-19 fastener should be installed ≥ 30mm away from the edges of insulation / isolation tapes that are ≤ 3 mm thick.

 $h_{NVS} = 8.2-9.8 \text{ mm}$ 

h<sub>NVS</sub> > 9.8 mm (washers are not compressed)

X-ENP-19 L15

h<sub>NVS</sub> < 8.2 mm (washers are strongly damaged by the tool piston)

<sup>\*</sup> Fastening type (b) covered for 5 mm ≤ t<sub>II</sub> < 6 mm, if N<sub>Bk</sub> is reduced to 6.6 kN Fastening type (b) fully covered for  $t_{\parallel}$  = 6 mm

# Design

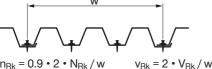

# Design shear and tension resistance

$$V_{Rd} = V_{Rk}/\gamma_{\text{M}} \qquad \qquad N_{Rd} = \alpha_{\text{cycl}} \; N_{Rk}/\gamma_{\text{M} \; \text{with}} \; \alpha_{\text{cycl}} = 1.0 \; \text{for all sheeting thickness t}_{l}$$
 
$$\alpha_{\text{cycl}} \; \text{considers the effect of repeated wind loads}$$

 $Y_M = 1.25$  in the absence of national regulations

Characteristic tension resistances  $n_{Rk}$  [kN/m] and shear resistances  $v_{Rk}$  [kN/m] per unit length, taking the effect of thermal constraints into account

 $N_{\text{Rk}}$  and  $V_{\text{Rk}}$  characteristic shear and tension resistance w ... width of the panel sheet

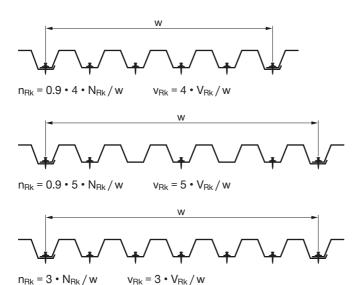

$$n_{Rk} = 0.9 \cdot 2 \cdot N_{Rk} / w$$
  $v_{Rk} = 2 \cdot V_{Rk} / w$ 

For a, b, c, d please refer to Application requirements, Sheet thicknesses and overlap types

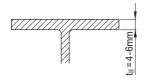

The same characteristic resistances can also be applied along supports at end-overlaps, if connection type "d" is not covered in the load table.

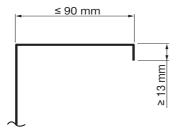

# **Application recommendation**

# Thickness of base material

 $t_{II} = 4.0 - 6.0$  mm for general shapes

Fastening to cold-formed C- and Z-sections with a thickness from 2.9 to 4.0 mm

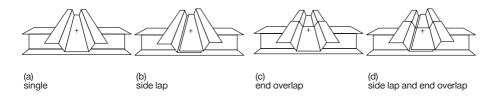

Fastening to U-shape concrete inlays with a nominal thickness  $t_{II}$  of 3 mm.  $t_{II} = 3.0 \pm 0.3$  mm

Grade: ≥ S320 GD according to EN 10346

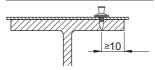

# Sheet thicknesses and overlap types

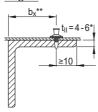

# Edge distances (mm)

# Rolled I or wide flange shapes

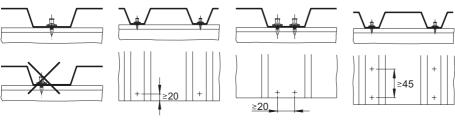

# Angles

- \* For t<sub>II</sub> = 3 to 4 mm, restrictions on application. See approval or contact Hilti.
- \*\* Maximum recommended  $b_x \le 8 \times t_{II}$  however, jobsite verification advisable.

# Trapezoidal profiles

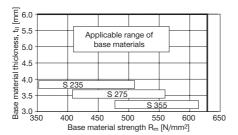

Centre fastenings in ribs

Clearance to end of sheet

Double fastenings Note: Reduce tensile resistance per fastener to 0.7 N<sub>Rk</sub>.

# Application limits

# **Corrosion information**

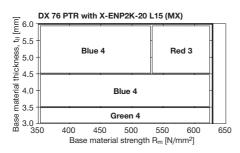

- The intended use only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres.
- For more details, please refer to following technical document: Hilti Corrosion Handbook

#### Performance data

Design data for use in the USA - Diaphragm strength

Approvals provide load tables or calculation procedures for determination of the allowable strength (in lbs/ft or kN/m) of a steel deck diaphragm. The allowable diaphragm strength depends on the type, strength and thickness of the decking, the span of the decking, the type and pattern of the deck to frame fasteners (X-HSN24, X-EDNK22 or X-EDN19) and the type and spacing of the sidelap connectors (e.g. Hilti sidelap connectors S-SLC 01 and S-SLC 02).

For more details it is referred to the technical literature of Hilti North America ("Steel Deck Fastening Systems" Hilti North America Product Technical Guide) and the "Decking Design Center" offered on the website www.us.hilti.com as well as the respective approvals.

| 16  | 1.52 | 975                       | 4.29 |  |  |

- Valid for steel sheet with a minimum tensile strength of 45 ksi (310 N/mm²). Values refer to failure controlled by the single sheet metal attached.
- For intermediate sheet thicknesses, linear interpolation is allowed.
- Recommended loads include safety factor 3.0 applied to mean shear resistance Q<sub>f</sub>. An equation for Q<sub>f</sub> is
  published in the SDI (Steel Deck Institute) Diaphragm Design Manual, 3<sup>rd</sup> edition.

| Recommended tension load N <sub>rec</sub> |      |       |      |                             |      |

| 16  | 1.52 | 435   | 1.95 | 340                         | 1.52 |

- Valid for steel sheet with minimum tensile strength of 45 ksi (310 N/mm²). Values are either controlled by pullover of sheet or by minimum value of fastener pullout of base metal.
- Values require fastener point penetration for X-EDNK22 and X-EDN19, of ¹/²0 (12.7 mm). Higher recommended values be applicable for X-HSN24 (see Hilti North America "Steel Deck Fastening Systems")
- Recommended loads include a safety factor 3.0 applied to mean pullover resistance or a safety factor 5.0 applied to the mean value of pullout resistance.

# Design data for use in Europe

Currently, the X-HSN24, X-EDNK22 and the X-EDN19 fasteners are only used in North America. Therefore, no design data is published evaluated in strict compliance with the provisions for European Technical Approvals.

For European markets, the fastener X-ENP2K-20 L15 in connection with the fastening tools DX 76 or DX 76 PTR are recommended for sheet metal fastenings to thin base materials (3 to 6 mm).

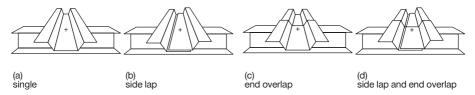

# **Application recommendation**

# Fastening tool DX 860-HSN, DX 9-HSN

| Fastener | Base material properties Thickness |             | Ultimate tensile strength |         |
|----------|------------------------------------|-------------|---------------------------|---------|
|          | [inch]                             | [mm]        | [ksi]                     | [N/mm²] |
| X-EDNK22 | 1/8" to 1/4"                       | 3.2 to 6.35 | 58 to 91                  | 400-630 |
| X-EDN19  | 3/16" to 5/16"                     | 4.8 to 8.0  | 58 to 91                  | 400-630 |
|          | 5/16" to 3/8"                      | 8.0 to 9.5  | 58 to 68                  | 400–470 |

- Comment on fastening tool DX 460-SM and DX 5-SM: This fastening tool is recommended for base
  material thickness from <sup>3</sup>/<sup>16"</sup> to <sup>3</sup>/<sup>6"</sup> (4.8 to 8.0 mm). The same strength limits apply as with the DX 860-HSN
  and DX 9-HSN.
- X-HSN24 covers full range of the fasteners X-EDNK22 and X-EDN19.

# Thickness of fastened material, fastener patterns, spacings and edge distance

As part of a steel deck diaphragm, all four fastening types (a), (b), (c) and (d) are executed with the X-HSN 24, X-EDNK22 and the X-EDN19. The sheet metal thickness typically varies between 22 Gauge (0.76 mm) and 16 Gauge (1.52 mm).

Dependent on the base material thickness and the frame fastener pattern, restrictions on the use of thicker decking might apply. For corresponding details of these provisions, it is referred to the quoted technical literature puplished by Hilti North America. This literature also contains details with respect to fastener patterns, spacings and edge distance adequately addressing the specifics of the diaphragm components used in the North American market

# **Corrosion information**

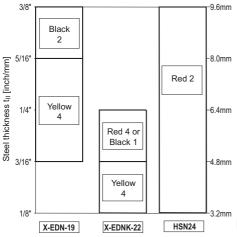

- The intended use only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

- Recommended working loads valid for steel sheets with a minimum tensile strength of ≥ 360 N/mm².
- For intermediate sheet thicknesses, use recommended load for next smaller thickness.
- Recommended loads are appropriate for EC1 (or similar) wind loading designs.
- The safety factor included is at least 2.0 applied to the static 5 % fractile value and 1.3 to the cyclic (5000 cycles) 5 % fractile value.

# **Application recommendation**

# Thickness of base material

Minimum thickness of concrete member

#### Conditions

- Applicable for X-HVB 80, X-HVB 95, X-HVB 110, X-HVB 125, X-HVB 140
- X-HVB are to be positioned parallel with beam

# **Decking geometric parameters**

# **Design information**

# Connector placement along the beam

The X-HVB is a ductile shear connector according to EN 1994-1-1, section 6.6, and may be uniformly distributed between critical sections. These critical sections, where large changes in shear flow occur, may be at supporting points, points of application of point loads or areas with extreme bending moments.

### Partial shear connection

# Strength:

The minimum connection depends on the design code used:

In EN 1994-1-1 design,  $N/N_{\rm f}$  must be at least 0.4. This increases depending on span length and decking geometry.

# Deflection control only

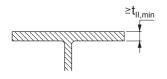

If the shear connection is needed for deflection control only, there is no minimum degree of connection. However, minimum allowable connector spacing applies and the steel beam must have enough strength to carry the self-weight and all imposed loads.

# Further specific design topics covered in the ETA-15/0876

- Coverage of seismic loading according to Eurocode 8 (EN 1998-1-1)
- Design resistance in case of use of old steel with an ultimate strength greater than 300 N/mm² and less than 360 N/mm²
- Effect of reduced base material thickness less than 8 mm for X-HVB 80 to X-HVB 140
- · Design of end anchorage of composite slabs
- · Design in case of a fire

# **Application recommendation**

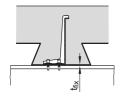

#### Thickness of base material

For beams with composite decking: minimum thickness t<sub>n</sub> = 8 mm.

For beams with solid concrete slabs: minimum thickness  $t_{\parallel}$  = 6 mm, especially relevant in renovation projects in order to take the thin flange thickness of small I-sections (e.g. IAO 100, I 100, IPE 100) into account.

#### Thickness of fastened material

Maximum total thickness of fixed sheeting  $t_{fix}$ :

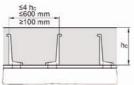

- 2.0 mm for X-HVB 80, X-HVB 95 and X-HVB 110
- 1.5 mm for X-HVB 125 and X-HVB 140

### Positioning of X-HVB connectors in solid concrete slabs

### X-HVB are to be positioned parallel with beam

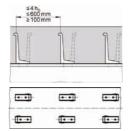

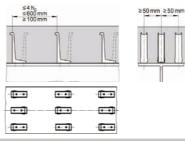

### 2 row of connectors

### Maximum 3 row of connectors

# Positioning of X-HVB connectors with composite deck (deck positioned transverse to; and X-HVB positioned parallel with beam axis)

### Spacing and positioning

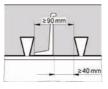

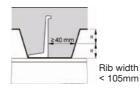

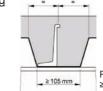

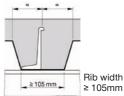

- a<sub>t</sub> ≥ 50 mm for compact profiled decking with  $b_0/h_p \ge 1.8$
- a<sub>t</sub> ≥ 100 mm for other decking

### 1 row of connector - Minimum rib width and spacing to decking

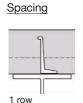

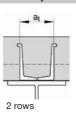

### Multiple rows of connector - Minimum rib width

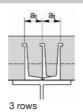

# Positioning of X-HVB connectors with composite deck (deck and X-HVB positioned transverse to beam axis)

### 2 rows:

a<sub>t</sub> ≥ 100 mm for all types decking

### 3 rows:

- $a_t \ge 50$  mm for compact profiled decking with  $b_0/h_0 \ge 1.8$
- a<sub>t</sub> ≥ 100 mm for other decking

### Positioning - 1 row of connectors

Without rib stiffener

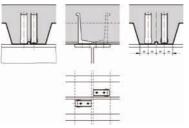

Preferred position in compression zone of concrete rib

### Positioning - 2 and 3 rows of connectors

Minimum width of deck rib

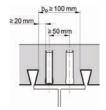

.

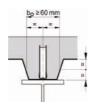

Contact with rib stiffener OR equi-spacing

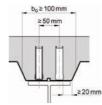

# Positioning of X-HVB connectors with composite deck (deck parallel with beam axis)

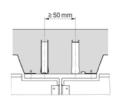

### X-HVB are to be positioned parallel with beam

# Spacing and positioning

 If a centric positioning within the concrete rib is not possible due to the shape of the composite decking, the decking needs to be split.

# "Duckwalk" positioning of X-HVB 40 and 50 in combination with thin solid slabs for renovation construction

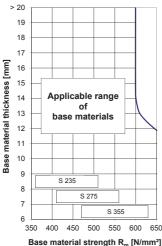

- Minimum section width = 40 mm (e.g. old section IAO 100)
- Minimum center distance of steel sections = 400 mm

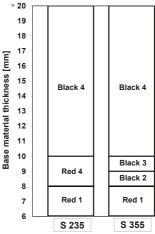

### **Application limits**

Application limits are valid only if correct cartridge and power setting are used!

### Application limits X-ENP-21 HVB

<u><u><u>u</u></u> 12 | <u><u>u</u> 12 | <u>u</u> 12 |</u></u>

Cartridge preselection and power setting

Fine adjustment by carrying out installation tests on site

Steel grade

Minimum section covered: IPE 100

steel, e.g. S 355M per EN 10025-4 the

application limit is reduced by 50 N/mm<sup>2</sup>

In thermo-mechanically rolled construction

· Minimum base material thickness for beams with composite decking: 8 mm

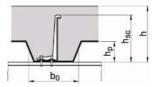

### **Fastener program**

### Minimum slab thickness

|       | Minimum slab t              | hickness h [mm]          |
|-------|-----------------------------|--------------------------|
| X-HVB | Without effect of corrosion | With effect of corrosion |
| 40    | 50                          | 60                       |
| 50    | 60                          | 70                       |

### **Product data**

### Product description

### X-X MX

X-X P8

- Innovative Helix nail tip for better drivability when fastening to tough concrete and steel.
- High hardness (58 HRC) nails for better penetration in tough concrete or steel.
- Optimized for use with Hilti tools helps to secure sufficient guidance and energy for driving straight and deep into the base material.

| ≥ 25 mm                               | 0.45 kN                       | 0.15 kN  | 0.45 kN                        | 0.25 kN  |

- Redundancy of fastening points is required.
  - Minimum number of fastening points for safety relevant fastenings: ≥ 5.

# Stick rate estimation

- The stick rate indicates the percentage of nails that were driven correctly to carry a load.
- Stick rate can vary from the above values depending on job site conditions.

### System recommendation

# X-U Nail for fastening to concrete and steel

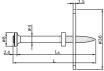

### **Product data**

### **Dimensions**

X-U \_\_ P8 S36

X-U 15 P8TH

### Material specifications

Carbon steel shank:

HRC 58 HRC 59 (X-U 15)

Zinc coating: 5–20 µm

### Recommended fastening tools

See fastener program in the next pages.

### **Approvals**

ICC ESR-2269 (USA) DIBt Z-14.4-517 (Germany), DNV-GL ABS, LR 97/00077, IBMB 4927/2020

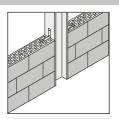

Not all information presented in this product data sheet might be subject to approval / certificate content.

Please refer to approval/certificate for further information.

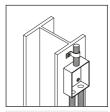

### **Applications**

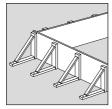

Wall-tie to steel and concrete

Mechanical and electrical fixtures

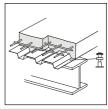

Drywall track to concrete and steel

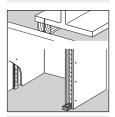

Conventional formwork

Tagging labels

Tacking of metal decks

Sill plates / 2x4 wood to concrete and steel

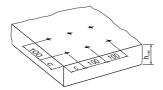

The intended use for safety relevant and permanent applications only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres.

# X-U Nail for fastening to concrete

# **Application recommendation**

Base material thickness and fastener positioning in base material

Base material thickness:  $h_{min}$  = 80 mm Edge distance: c ≥ 70 mm Spacing: s ≥ 100 mm

# Fastener shank length recommendation

- For safety relevant fastenings sufficient redundancy of the entire system is required: Minimum 5 fastenings per fastened unit.
- All visible failures must be replaced.
- Valid for concrete with strength of f<sub>CC</sub> ≤ 45 N/mm<sup>2</sup>.
- Valid for predominantly static loading.
- Failure of the fastened material is not considered in recommended loads.
- To limit penetration of nail and to increase pull-over load, use nails with washers.
- For more details in relation to base material properties, please refer to the chapter **Fastener selection guide** in the Direct Fastening Manual (DFTM).

### System recommendation

# X-U Nail for fastening steel to steel

### **Application recommendation**

### Fastener shank length recommendation

|   | Fastening type | Fastener shank length  | Penetration depth           |
|---|----------------|--|-----------------------------|
| there the there is a second of the there is a | Steel to steel | L <sub>s</sub> = h <sub>ET</sub> + t <sub>l</sub> not pre-drilled: $t_l \le 3 \text{ mm}$ pre-drilled: $3 \text{ mm} < t_l \le 6 \text{ mm}$ | h <sub>ET</sub> = 12 ± 2 mm |

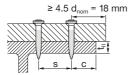

### Condition for fastened material thickness: 3 mm < tl ≤ 6 mm

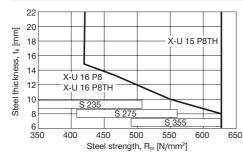

If a gap between the fastened part and the base material is unacceptable, the fastened part needs to be prepared with drilled holes.

### Base material properties and fastener positioning in base material

 $\begin{array}{lll} \text{Base material thickness:} & t_{\parallel} \geq 6.0 \text{ mm} \\ \text{Edge distance:} & c \geq 15 \text{ mm} \\ \text{Spacing:} & s \geq 20 \text{ mm} \\ \text{Type:} & \text{Rolled shapes} \end{array}$ 

# Application limitation

- Steel sheeting with 0.75 mm ≤ t<sub>l</sub> ≤ 1.25 mm
- On higher steel grades, fastening with single nails (P8 or P8TH) may yield better results (e.g. less shear breaks) than fastening with collated nails (MX or MXSP) due to better nail guidance.

### Performance data

Recommended resistance under tension and shear load

Fastening of steel sheets and other steel parts with X-U 16 and X-U 19

|                | X-U_P8/MX        | X-U_S12          |                  |
|----------------|------------------|------------------|------------------|
| t <sub>I</sub> | N <sub>rec</sub> | N <sub>rec</sub> | V <sub>rec</sub> |
| 0.75 mm        | 1.0 kN           | 1.4 kN           | 1.2 kN           |
| 1.00 mm        | 1.2 kN           | 1.8 kN           | 1.8 kN           |
| 1.25 mm        | 1.5 kN           | 2.2 kN           | 2.6 kN           |
| ≥ 2.00 mm      | 2.0 kN           | 2.2 kN           | 2.6 kN           |

### Tacking of steel sheets with X-U 15

according to ECCS-recommendation N73, "Good Construction Practice for Composite Slabs"

| t <sub>I</sub> | N <sub>rec</sub> | V <sub>rec</sub> |
|----------------|------------------|------------------|
| 0.75-1.25 mm   | 0.6 kN           | 0.8kN            |

### Conditions

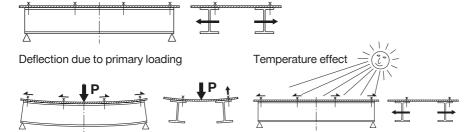

- Valid for steel sheet with minimum tensile strength ≥ 360 N/mm².
- For intermediate sheet thicknesses, use recommended load for next smaller thickness.
- In case of a design based on the characteristic resistance, recommended values have to be multiplied by two: N<sub>Rk</sub> = N<sub>rec</sub> · 2.0, V<sub>Rk</sub> = V<sub>rec</sub> · 2.0
- For X-U 16 S12:

Base material thickness  $t_{II,min}$  = 8 mm for  $t_I \ge 1.50$  mm Base material thickness  $t_{II,min}$  = 6 mm for  $t_I \le 1.25$  mm

- Other fastened parts: clips, brackets, etc.
- Redundancy (multiple fastening) must be provided.
- · Valid for predominantly static loading

### Forces of constraint

When fastening large pieces of steel, the possibility of shear loadings from forces of constraint should be considered. Avoid exceeding  $V_{\text{rec}}$  for the fastener shank!

### System recommendation

 For more details, please refer to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

Cartridge recommendation for X-U 16 P8, X-U 16 P8 TH, X-U 16 MX

- Correct according requirement from chapter quality assurance.

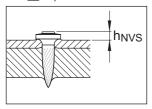

# **Quality assurance**

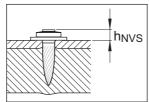

# Setting depth control

# X-U \_\_ P8/MX

 $h_{NVS} = 2.5-4.5 \text{ mm}$ 

# X-U\_\_S12

 $h_{NVS} = 4.0-5.5 \text{ mm}$ 

# $X-U_P8TH/MXSP$

 $h_{NVS} = 4.0-6.0 \text{ mm}$ 

# X-U Nail for fastening wood to steel

### **Application recommendation**

Base material properties

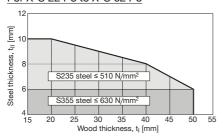

Base material thickness: t<sub>II</sub> ≥ 4.0 mm

### Fastener shank length recommendation

|       | Fastening type                               | Fastener shank length   | Penetration depth     |
|-------|--|---|-----------------------|
| Ti ti | Wood to steel                                | $L_s = h_{ET} + t_l$<br>$t_l = 15-57 \text{ mm}$                | h <sub>ET</sub> ≥8 mm |
| hET   | Wood to steel,<br>head flush with<br>surface | $L_s = h_{ET} + t_i - 3 \text{ mm}$<br>$t_i = 15-57 \text{ mm}$ | h <sub>ET</sub> ≥8 mm |

### Application limitation

### For X-U 22 P8 to X-U 62 P8

### Performance data

### Recommended resistance under tension and shear load

| Designation | Tension load<br>N <sub>rec</sub> | ▼ Nrec | Shear load<br>V <sub>rec</sub> | <b>V</b> rec |
|-------------|----------------------------------|--------|--------------------------------|--------------|
| X-U         | 0.3 kN                           |        | 0.60 kN                        |              |

### Conditions:

- For safety-relevant fastenings sufficient redundancy of the entire system is required.
- In case soft material is fastened, its strength determines the loads.
- To limit penetration of nail and to increase pull-over load, use nails with washers.
- Observance of edge distance and fastener spacing in compliance with recognized standards EN 1995 (see approval).
- With respect to details of fastening wood, chipboard or OSB members to steel base material, it is referred to the German approval DIBt Z-14.4-517.

### System recommendation

 For more details, please refer to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

# X-P Nail for fastening to concrete and steel

### **Product data**

### Product description

### X-P MX

- Designed for fastening on tough concrete and steel.
- Long conical nail tip designed for best drivability in tough concrete.
- High hardness for best penetration in tough concrete.
- High load performance on tough concrete.

### X-P P8

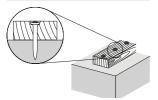

### Dimensions for nails Technical drawing Designation Shank Head Shank Head length length diameter diameter $L_s$ $L_h$ $d_s$ $d_h$ X-P 22 22 mm X-P 27 27 mm X-P 34 34 mm X-P 40 40 mm X-P 47 47 mm 2.4 mm 8.2 mm 4 mm X-P 52 52 mm X-P 57 57 mm X-P 62 62 mm X-P 72 72 mm

# Material specification and material properties for nails Designation Element Material Coating Minimum coating thickness X-P Nail Carbon steel Zinc 5 μm 59 HRC

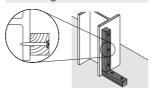

# **Applications**

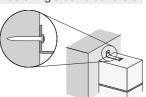

# Fastening wood to concrete

# Fastening wood to steel

# Fastening steel to concrete

### Base materials

Soft Medium Tough Steel concrete concrete

### Load conditions

Static/ quasi static

### **Environmental conditions**

Dry indoor

# X-P Nail for fastening wood to concrete

### **Application recommendation**

Fastened material properties and fastener positioning in fastened material

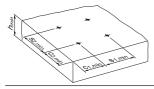

| Fastened material                   | Wood                   |
|-------------------------------------|------------------------|
| Fastened material                   | 15-50 mm               |
| thickness t <sub>I</sub>            | (soft/medium concrete) |
| Fastened material                   | 15-40 mm               |
| thickness t <sub>I</sub>            | (tough concrete)       |
| Edge distance c <sub>1,min</sub>    | 250 mm                 |
| Edge distance c <sub>2,min</sub>    | 20 mm                  |
| Fastener spacing s <sub>1,min</sub> | 500 mm                 |

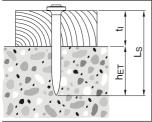

• Edge distances and fastener spacing are recommendations to avoid splitting.

### Base material properties and fastener positioning in base material

| Base material  | Concrete |
|--|----------|
| Base material thickness h <sub>min</sub>                 | 80 mm    |
| Edge distance c <sub>1,min</sub> , c <sub>2,min</sub>    | 70 mm    |
| Fastener spacing s <sub>1,min</sub> , s <sub>2,min</sub> | 100 mm   |
|  |          |

# Fastener shank length recommendation

| 4 | For standard fastening: | $L_s = h_{ET} + t_I$                |
|---|-------------------------|-------------------------------------|
| * | For flush fastening:    | $L_s = h_{ET} + t_I - 3 \text{ mm}$ |

### Performance data

- Redundancy of fastening points is required.
- Minimum number of fastening points for safety relevant fastenings: ≥ 5.
- For more details in relation to base material properties, please refer to the chapter **Fastener selection guide** in the Direct Fastening Technology Manual (DFTM).

<sup>1)</sup> Black cartridges do not apply for this tool.

- Tool power level adjustment by setting tests on site.
- Start tool energy selection with lowest recommended tool power level.
- Correct according requirement from chapter quality assurance.

#### **Quality assurance**

Setting depth control and power tool adjustment

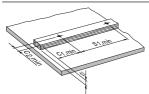

- 0
- Visible setting failures must be replaced with a new fastener, not in the same hole.
  - These are abbreviated instructions which may vary by application.
  - Always review/follow the instructions accompanying the product.

# X-P Nail for fastening wood to steel

### **Application recommendation**

Fastened material properties and fastener positioning in fastened material

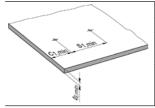

| Fastened material                   | Wood     |
|-------------------------------------|----------|
| Fastened material                   | 15-50 mm |
| thickness t <sub>i</sub>            |          |
| Edge distance c <sub>1,min</sub>    | 250 mm   |
| Edge distance c <sub>2,min</sub>    | 20 mm    |
| Fastener spacing s <sub>1,min</sub> | 500 mm   |

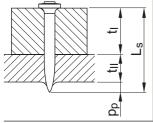

• Edge distances and fastener spacing are recommendations to avoid splitting.

# Base material properties and fastener positioning in base material

| Base material                           | Steel   |
|---|---------|
| Base material thickness t <sub>II</sub> | 4–10 mm |
| Edge distance c <sub>1,min</sub>        | 15 mm   |
| Fastener spacing s <sub>1,min</sub>     | 20 mm   |
|   |         |
|   |         |

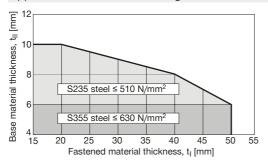

# Fastener shank length recommendation

| - | For standard fastening:                          | $L_s = t_l + t_{ll} + 6 \text{ mm}$ |
|---|--|-------------------------------------|
|   | For flush fastening:                             | $L_s = t_l + t_{ll} + 3 \text{ mm}$ |
| - | Penetration of nail point through base material: | p <sub>p</sub> ≥ 6 mm               |

#### Application limitation for fastening on steel

- For X-P 22 P8 to X-P 62 P8
  - On higher steel grades, fastening with single nails (P8) may yield better results (e.g. less shear breaks) than fastening with collated nails (MX) due to better nail guidance.

#### Performance data

Recommended resistance under tension and shear load

| Designation | Tension load N <sub>rec</sub> | ▼ N <sub>rec</sub> | Shear load<br>V <sub>rec</sub> | ▼ V <sub>rec</sub> |
|-------------|-------------------------------|--------------------|--------------------------------|--------------------|
| X-P         | 0.40 kN                       |                    | 0.60 kN                        |                    |

#### System recommendation

 For more details, please refer to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

System recommendation for fastening collated nails with powder-actuated tools

- Redundancy of fastening points is required.
- Minimum number of fastening points for safety relevant fastenings: ≥ 5.
- For more details in relation to base material properties, please refer to the chapter
   Fastener selection guide in the Direct Fastening Technology Manual (DFTM).

#### Stick rate estimation

- The stick rate indicates the percentage of nails that were driven correctly to carry a load.
- Stick rate can vary from the above values depending on job site conditions.

<sup>1)</sup> Black cartridges do not apply for this tool.

- Tool power level adjustment by setting tests on site.
  - Start tool energy selection with lowest recommended tool power level.
  - Correct according requirement from chapter quality assurance.

#### **Quality assurance**

Setting depth control and power tool adjustment

- Visible setting failures must be replaced with a new fastener, not in the same hole.
   These are abbreviated instructions which may vary by application.
  - Always review/follow the instructions accompanying the product.

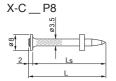

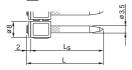

# X-C Nail - Fastening to concrete and sand lime masonry

#### **Product data**

#### **Dimensions**

#### X-C \_\_ MX

#### X-C \_\_ P8S23

#### Material specifications

Carbon steel shank: HRC 56.5

HRC 58 \*)

Zinc coating: 5–20 µm

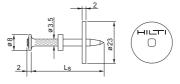

\*) X-C 82, 97 and 117 P8 (d<sub>nom</sub> = 3.7 mm)

## Recommended fastening tools

 See fastener program in the next pages.

# X-C \_\_ P8S23T (for tunneling applications)

## Examples

Conventional formwork

C36

System formwork

Drywall track to concrete

#### Performance data

#### Recommended resistance under tension and shear load

| Fastening wood to concrete: |           |                 |  |  |  |  |  |  |  |
|-----------------------------|-----------|-----------------|--|--|--|--|--|--|--|
| N <sub>rec</sub>            | $V_{rec}$ | h <sub>ET</sub> |  |  |  |  |  |  |  |
| 0.4 kN                      | 0.4 kN    | ≥ 27 mm         |  |  |  |  |  |  |  |
| 0.3 kN                      | 0.3 kN    | ≥ 22 mm         |  |  |  |  |  |  |  |
| 0.2 kN                      | 0.2 kN    | ≥ 18 mm         |  |  |  |  |  |  |  |
| 0.1 kN                      | 0.1 kN    | ≥ 14 mm         |  |  |  |  |  |  |  |

Fastenings to sandlime masonry:

 $N_{rec} = V_{rec} = 0.4 \text{ kN for } h_{ET} \ge 27 \text{ mm}$ 

#### Conditions:

- For safety relevant fastenings sufficient redundancy of the entire system is required: minimum 5 fastenings per fastened unit.
- All visible failures must be replaced.
- Valid for concrete with strength of f<sub>cc</sub> < 45 N/mm<sup>2</sup>.
- · Valid for predominantly static loading.
- Failure of the fastened material is not considered in recommended loads.
- To limit penetration of nail in soft material and to increase pullover load, use nails with washers.
- For more details in relation to base material properties, please refer to the chapter Fastener selection guide in the Direct Fastening Manual (DFTM).

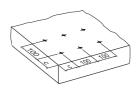

#### **Application recommendation**

# Base material and fastened material thickness

Concrete  $h_{min} = 80 \text{ mm}$  $t_{l} \le 50.0 \text{ mm}$ 

#### Fastener positioning in base material

Edge distance:  $c \ge 70 \text{ mm}$ Spacing:  $s \ge 100 \text{ mm}$ 

#### Fastener shank length recommendation

 $L_S = h_{ET} + t_I [mm]$ For standard fastening: For flush fastening:  $L_S = h_{FT} + t_1 - 5 \text{ [mm]}$ 

 $h_{ET} = 22 \text{ mm}$ Concrete: Sandlime masonry:  $h_{FT} = 27 \text{ mm}$ 

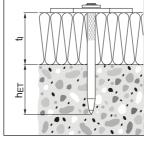

Fastening wood to concrete  $t_1 = 15 - 40 \text{ mm}$ 

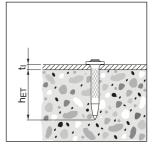

insulation to concrete  $t_1 = 15 - 40 \text{ mm}$ 

Fastening

Fastening steel to concrete  $t_1 = 0.6 - 2 \text{ mm}$ 

#### **Corrosion information**

- The intended use for safety relevant and permanent applications only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

#### System recommendation

• For more details, please refer to the chapter **Accessories and consumables compatibility** in the Direct Fastening Technology Manual (DFTM).

# Cartridge recommendation for fastening wood to masonry and concrete

| Base material        | Cartridge color (tool power level) |                                    |  |  |  |  |

# X-S Nail for fastening drywall track to steel

#### **Product data**

#### **Dimensions**

X-S13 THP

X-S16 P8TH

#### Material specifications

Carbon steel shank:

X-S 16 P8 TH HRC 55.5 X-S13 THP/MX HRC 52.5 Zinc coating: 5–13 μm

Recommended fastening tools
DX 6 MX, DX 460 MX, DX 5 MX, DX 36,
DX 2, DX 351 MX, DX-E 72
DX 6 F8, DX 460 F8, DX 5 F8, DX 351 F8,

• See fastener program in the next pages.

#### Approvals

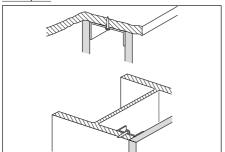

ICC (USA): X-S (ESR-1752)

Not all information presented in this product data sheet might be subject to approval / certificate content. Please refer to approval/certificate for further information.

#### **Applications**

#### Examples

Drywall tracks to steel

#### Performance data

#### Recommended resistance under tension and shear load

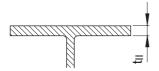

Steel 0.4 kN

#### Conditions:

- Redundancy (multiple fastening) must be provided
- All visible failures must be replaced

# **Application recommendation**

#### Thickness of base material

Steel:

 $t_{\parallel} \ge 4 \text{ mm}$ 

#### Thickness of fastened material

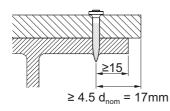

Wooden track:

t₁ ≤ 24 mm

Metal track:

 $t_i \le 2 \text{ mm}$ 

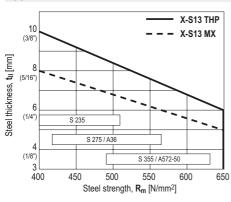

#### Fastener positioning

Edge distance:

c ≥ 15 mm

### Application limits

DX 351

#### **Corrosion information**

- The intended use only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

#### System recommendation

• For more details, please refer to the chapter **Accessories and consumables compatibility** in the Direct Fastening Technology Manual (DFTM).

# DS Heavy-duty nail for fastening to concrete and steel

#### **Product data**

#### **Dimensions**

DS \_\_ P10

#### Material specifications

Carbon steel shank: HRC 54 (DS)

HRC 58 (DSH)

Zinc coating: 5–20 µm

Recommended fastening tools DX 6 F10, DX 5 F10, DX 460 F10, DX 76, DX 76 PTR

- See fastener program in the next pages.
- For more details, please refer to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

#### Approvals

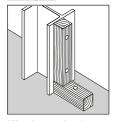

ICC (USA) LR 97/00077

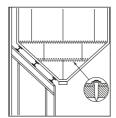

Not all information presented in this product data sheet might be subject to approval / certificate content. Please refer to approval/certificate for further information.

#### **Applications**

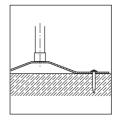

#### Examples

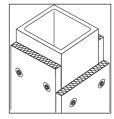

Wood to steel and concrete

Plastic and rubber to steel

Metal parts to concrete

Soft material to steel and concrete

#### Performance data

Recommended resistance under tension and shear load

Fastening wood to concrete, sandlime masonry or steel

Fastening wood to concrete, sandlime masonry:

$$N_{rec} = V_{rec} = 0.4 \text{ kN}$$

Fastening wood to steel:

$$N_{rec} = V_{rec} = 0.6 \text{ kN}$$

#### Conditions

- For safety-relevant fastenings sufficient redundancy of the entire system is required: minimum 5 fastenings per fastened unit with normal weight concrete base material.
- All visible failures must be replaced.
- Valid for concrete and sandlime masonry with strength of f<sub>cc</sub> < 40 N/mm<sup>2</sup>.
- Fastened material: wood, minimum thickness = 24 mm plywood, minimum thickness = 16 mm

#### Soft material

- Working loads depend on strength and thickness of material fastened. Do not use working loads in excess of those for wood.
- Depth of penetration and other conditions same as for fastening wood.
- Use R23 or R36 (Ø 4.5 mm hole) washer to control penetration and to increase pull-over strength. Separately available from Hilti.

#### Metal profiles to concrete

- $N_{rec} = V_{rec} = 0.4 \text{ kN}$
- Minimum 5 fastenings per fastened unit (normal weight concrete)
- $\bullet$  Increase to 600 N possible if 8 or more fastenings in each fastened unit.
- All visible failures must be replaced
- $t_1 = 1-4 \text{ mm}$

 For more details in relation to base material properties, please refer to the chapter Fastener selection guide in the Direct Fastening Manual (DFTM).

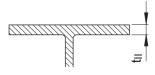

#### **Application recommendation**

#### Base material thickness

Concrete

 $h_{min} = 100 \text{ mm } (d_{nom} \ge 4.5 \text{ mm})$ 

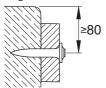

Steel  $t_{II} \ge 6 \text{ mm}$ 

#### Fastened material thickness

 $t_1 \le 50.0 \text{ mm}$ 

#### Fastener positioning

# Edge distance: concrete (mm)

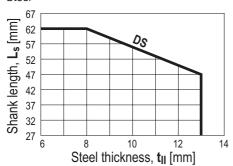

# Edge distance: steel (mm)

Spacing a = 20 mm

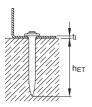

#### Application limits

#### Steel

### Fastener shanks length recommendation for fastening to concrete

Required nail shank length:

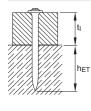

Wood or

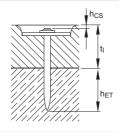

metal profiles  $L_S = h_{ET} + t_I [mm]$ 

Soft material  $L_S = h_{ET} + t_I - 2 - h_{CS}$  [mm]

 $h_{CS} \approx 3 \text{ mm if possible}$ 

# Required depth of penetration hET

h<sub>ET</sub> ≥ 27 mm

# Fastener shanks length recommendation for fastening to steel

 $h_{FT} = 17-27 \text{ mm}$ 

#### **Corrosion information**

- The intended use for safety-relevant and permanent applications only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

### System recommendation

• For more details, please refer to the chapter **Accessories and consumables compatibility** in the Direct Fastening Technology Manual (DFTM).

Nail length limits are for use without pre-driving into the wood. Hand-driving the nail into the wood and bringing the DX tool into position over the nail head extend the nail length range for the tools.

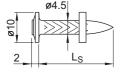

# **EDS Nail for fastening to steel**

#### **Product data**

**Dimensions** 

EDS\_P10

#### Material specifications

Carbon steel shank:

EDS 19/22 HRC 55.0 Zinc coating: 10–25 µm

#### Recommended fastening tools

DX 76, DX 76 PTR

 For more details, please refer to EDS fastener program and to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

#### Approvals and certificates

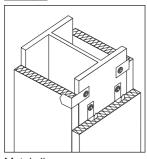

ICC (USA), ABS, LR, DNV-GL

 Not all information presented in this product data sheet might be subject to approval/certificate content. Please refer to approval/certificate for further information.

#### **Applications**

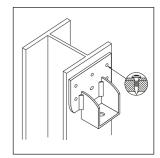

#### Example

Angle bracket

Mounting bracket

#### Performance data

Recommended loads (predominantly static)

| Steel sheet fastening |                       |                       |
|-----------------------|-----------------------|-----------------------|
|                       | EDS _ P10             |                       |
| t <sub>i</sub> [mm]   | N <sub>rec</sub> [kN] | V <sub>rec</sub> [kN] |
| 0.75                  | 1.1                   | 1.5                   |
| 1.00                  | 1.3                   | 2.3                   |
| 1.25                  | 1.7                   | 3.2                   |
| ≥ 2.00                | 2.4                   | 4.0                   |

- Recommended loads valid for steel sheet with minimum tensile strength ≥ 360 N/mm².
- For intermediate sheet thicknesses, use recommended load for next smaller thickness.
- ullet N<sub>rec</sub> and V<sub>rec</sub> include an overall safety factor of 3.0 applied to the characteristic test data. Static test:  $N_{rec} = N_{test,k}/3.0$ ,  $V_{rec} = V_{test,k}/3.0$

#### Forces of constraint

When fastening large pieces of steel, the possibility of shear loadings from forces of constraint should be considered. Avoid exceeding V<sub>rec</sub> for the fastener shank!

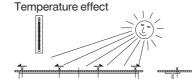

Deflection due to primary loading

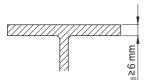

#### **Application recommendation**

#### Thickness of base material

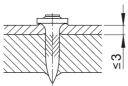

|     | t <sub>ll</sub> (mm) |
|-----|----------------------|
| EDS | ≥6                   |
|     |                      |

#### Thickness of fastened material

#### $t_1 \le 3 \text{ mm}$

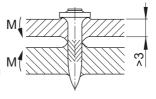

Steel fastened material ≤ 3 mm thick, usually deforms with the displaced base material to allow a tight fit between fastened steel and base material without predrilling.

Because conditions may vary, trial fastenings are recommended

#### $t_1 > 3 \text{ mm}$

Without pre-drilling: steel fastened material > 3 mm thick is too stiff to deform entirely with the displaced base material. The gap, which increases with increasing t<sub>1</sub>, can result in bending moments being applied to the nail shank.

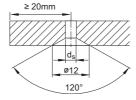

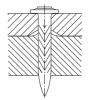

To prevent imposition of a moment on the shank of fastener, use three fasteners in a group.

#### With pre-drilling:

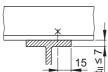

If a gap between the fastened part and the base material is unacceptable, the fastened part can be prepared with drilled holes.

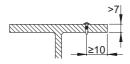

#### Spacing and edge distances (mm)

#### Base material

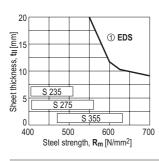

#### Fastened material

# Application limits

#### ① EDS with DX76 and DX 76 PTR

- Limit line valid for steel,  $t_1 \le 3 \text{ mm}$
- For steel  $t_l > 3$  mm and without pre-drilling, either make trial fastenings or adjust  $t_{ll}$  to  $t_{ll} + t_l$  before using the chart.

#### **Corrosion information**

- The intended use only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

■ = suitable

☐ = requires expert evaluation

• For more details, please refer to following technical document(s): Hilti Corrosion Handbook.

| Constraint forces |   |
|-------------------|---|
| Technical drawing | Description   |
|                   | No constraint forces, undisturbed system                |
| IP 1              | Constraint forces due to primary loading and deflection |
|                   | Constraint forces due to temperature effect             |

 When fastening large pieces of steel or aluminium, the possibility of shear loading due to forces of constraint must be taken into account in the fastening design.
 Allowance must be made for movement or, alternatively, forces of constraint must be taken into account in the design and maximum shear force limited by way of V<sub>rec</sub>.

- Tool power level adjustment by setting tests on site (see chapter quality assurance).
- Start tool energy selection with lowest recommended tool power level.
- Correct according requirement from chapter quality assurance.

#### Fastener stand-off

- Visible setting failures must be replaced with a new fastener, not in the same hole.
- These are abbreviated instructions which may vary by application.
  - Always review/follow the instructions accompanying the product.

# X-CR Stainless steel nail for fastening to steel

## **Product data**

# Product description

X-CR P8

- · Stainless steel nail
- · Corrosion-resistant
- Designed for fastening on steel
- Engineered for high-quality, reliable fastening
- · Suitable for universal use

#### Dimensions for nails without washer

■ = suitable

☐ = requires expert evaluation

• For more details, please refer to following technical document(s): Hilti Corrosion Handbook.

 When fastening large pieces of steel or aluminium, the possibility of shear loading due to forces of constraint must be taken into account in the fastening design.
 Allowance must be made for movement or, alternatively, forces of constraint must be taken into account in the design and maximum shear force limited by way of V<sub>rec</sub>.

- Tool power level adjustment by setting tests on site (see chapter quality assurance).
- Start tool energy selection with lowest recommended tool power level.
- Correct according requirement from chapter quality assurance.

#### Fastener stand-off

 $h_{NVS} = 3.0-4.5 \text{ mm}$ 

- Visible setting failures must be replaced with a new fastener, not in the same hole.
- These are abbreviated instructions which may vary by application.
- Always review/follow the instructions accompanying the product.

# X-CR Stainless steel nail for fastening to concrete, sand lime masonry and steel

## **Product data**

#### **Dimensions**

X-CR \_\_ P8 S12

#### X-CR P8 S15

## Material specifications

Nail shank: CrNiMo Alloy

f<sub>u</sub> ≥ 1800 N/mm<sup>2</sup>

(49 HRC)

Zinc coating: X-CR 48/52 P8 S15 has

5-13 µm

Zinc coating to improve anchorage in concrete

#### Recommended fastening tools

DX 6, DX 5, DX 460, DX 36, DX 2, DX-E72

## Approvals

ABS, LR:

all types

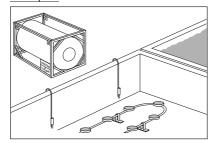

Not all information presented in this product data sheet might be subject to approval / certificate content.

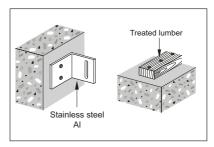

Please refer to approval/certificate for further information.

## **Applications**

#### Examples

Exposure to weather or otherwise corrosive conditions

Noble or corrosive fastened material

#### Performance data

Recommended resistance under tension and shear load for DX Standard

Fastening wood to concrete, sandlime masonry or steel

Fastening wood to concrete, sandlime masonry:

$$N_{rec} = V_{rec} = 0.4 \text{ kN}$$

Fastening wood to steel:

$$N_{rec} = V_{rec} = 0.6 \text{ kN}$$

## **Conditions**

- For safety relevant fastenings sufficient redundancy of the entire system is required: minimum 5 fastenings per fastened unit with normal weight concrete base material.
- · All visible failures must be replaced.
- Valid for concrete and sandlime masonry with strength of fcc < 40 N/mm<sup>2</sup>.
- · Valid for predominantly static loading.

## Soft material

- Working loads depend on strength and thickness of material fastened. Do not use working loads in excess of those for wood.
- Depth penetration and other conditions same as for fastening wood
- Use R23 or R36 (Ø 4.5 mm hole) washer to control penetration and to increase pull-over strength. Separately available from Hilti.

Recommended resistance under tension and shear load for DX-Kwik (with pre-drilling)

|            | N <sub>rec,1</sub> | N <sub>rec,2</sub> | V <sub>rec</sub> | M <sub>rec</sub> |
|------------|--------------------|--------------------|------------------|------------------|
| X-CR 39/44 | 2.0 kN             | 0.6 kN             | 2.0 kN           | 5.5 kN           |
| X-CR 48    | 3.0 kN             | 0.9 kN             | 3.0 kN           | 5.5 kN           |

#### Conditions

- N<sub>rec.1</sub>: concrete in compressive zone.
- N<sub>rec 2</sub>: concrete in tension zone.
- Static or cyclic (5000 load applications) loading.
- f<sub>cc</sub> ≥ 25 N/mm<sup>2</sup>. For higher concrete strengths, higher loadings may be possible if supported by testing.
- A sufficient redundancy has to be ensured, that the failure of a single fastening will not lead to collapse of the entire system.
- Recommended loads are based on failure of the fastener anchorage in the concrete.
   Thickness and quality of the fastened material may lower the loadings.
- Observance of all pre-drilling requirements, fastened thickness limits, and recommended details.

 For more details in relation to base material properties, please refer to the chapter Fastener selection guide in the Direct Fastening Manual (DFTM).

# **Application recommendation**

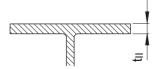

#### Base material thickness

#### Concrete

 $h_{min} = 80 \text{ mm} (d_{nom} = 3.7 \text{ mm})$ 

 $h_{min} = 90 \text{ mm} (d_{nom} \ge 4.0 \text{ mm})$ 

#### Steel

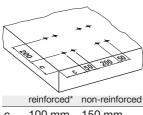

t<sub>II</sub> ≥ 5 mm for fastening of wood

#### Fastened material thickness

t<sub>1</sub> ≤ 25.0 mm (detailed information see fastener selection)

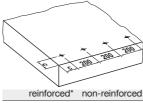

## Fastener positioning in base material

#### **Pairs**

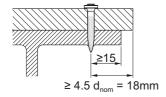

# c 100 mm 150 mm

# Row along edge

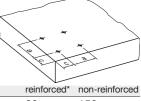

# 150 mm

 $<sup>^{\</sup>star}$  Minimum  $\varnothing$  6 mm reinforcing steel continuous along all edges and around all corners. Edge bar must be enclosed by stirrups.

# General (e.g. group of fasteners)

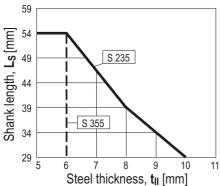

|   | reinforced* | non-reinforced |
|---|-------------|----------------|
| С | 80 mm       | 150 mm         |
| а | 80 mm       | 100 mm         |

c 80 mm 150 mm

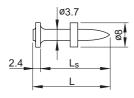

## Application limits

# Fastener shanks length recommendation for DX Standard

 $L_S = h_{ET} + t_I [mm]$ Wood: Soft material:  $L_S = h_{ET} + t_I - 2.4 - h_{cs}$  [mm]  $h_{CS} \cong 3 \text{ mm if possible}$ 

## Required depth of penetration hET

## Normal weight concrete NWC

| Tronna woight concrete treve         |    |    |    |  |  |  |
|--------------------------------------|----|----|----|--|--|--|
| f <sub>cc</sub> [N/mm <sup>2</sup> ] | 15 | 25 | 35 |  |  |  |

# Light weight concrete LWC

 $h_{ET} = 32-37 \text{ mm}$ 

Steel

h<sub>ET</sub> ≥ 10 mm

Normal weight concrete NWC

Sandlime masonry SLM

Steel

#### **Corrosion information**

- For fastenings exposed to weather or other corrosive conditions. Not for use in highly corrosive surroundings like swimming pools or highway tunnels.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

#### System recommendation

 For more details, please refer to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

<sup>2)</sup> DX-Kwik (with pre-drilling)

<sup>&</sup>lt;sup>3</sup>) Fastener for fixing Hilti brackets MFT-FOX V, MFT-FOX VI (For more details, please refer to ETA-14/0426)

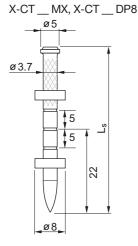

# X-CT Nail for forming or other temporary use

## Product data

## **Dimensions**

# Material specifications

Carbon steel shank: HRC 53 Zinc coating: 5–20 µm

# Recommended fastening tools

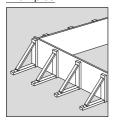

DX 6 MX, DX 5 MX, DX 460 MX DX 6-F8, DX 5-F8, DX 460-F8, DX 36, DX 2, DX-E72

• See fastener program in the next pages.

# **Applications**

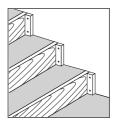

## Examples

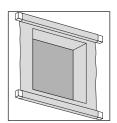

Conventional Formwork

System Formwork

To position and hold concrete formwork

Fasten plastic, netting, etc.

#### Performance data

Recommended resistance under shear load

#### Conditions

- Static loading only (placing and vibration of concrete does not affect design).
- Minimum 5 fastenings per fastened unit.

 $V_{rec} = 0.3 \text{ kN for h}_{ET} \ge 22 \text{ mm}$ 

• For more details in relation to base material properties, please refer to the chapter **Fastener selection guide** in the Direct Fastening Manual (DFTM).

## **Application recommendation**

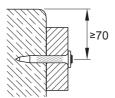

Base material and fastened material thickness

 $h_{min}$  = 80 mm

 $t_{l} = 20-50 \text{ mm}$ 

## Fastener positioning

Edge distances c ≥ 70 mm

# Fastener shank length recommendation

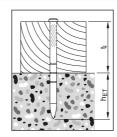

## Required nail shank length

$$L_S = h_{ET} + t_l [mm]$$

#### Recommendation

Concrete

 $h_{ET} = 22 \text{ mm}$ 

# System recommendation

• For more details, please refer to the chapter **Accessories and consumables compatibility** in the Direct Fastening Technology Manual (DFTM).

# DX-Kwik – X-M6 H, X-M8 H and DNH, X-DKH Threaded studs and nails

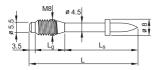

# **Product data**

#### **Dimensions**

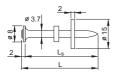

X-M6H- -37 FP8

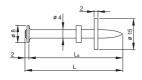

X-M8H -37 P8

#### **DNH 37 P8S15**

## X-DKH 48 P8S15

## Material specifications

Carbon steel shank: HRC 58
Zinc coating: 5–20 µm

# Recommended fastening tools

DX 6 F8, DX 5 F8, DX 460 F8, DX 2

• See fastener program in the next pages.

#### Approvals

IBMB 3041/8171 X-M8H, X-DKH, X-M6H

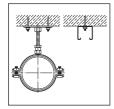

DIBt (Germany): X-M8H

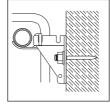

Not all information presented in this product data sheet might be subject to approval / certificate content. Please refer to approval/certificate for further information.

# **Applications**

# Examples

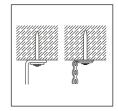

Base plates, rails for piping

Radiator brackets

Floor stands, metal fixtures to concrete

Suspended ceilings

#### Performance data

#### Recommended resistance under tension and shear load

|                 | N <sub>rec,1</sub> | N <sub>rec,2</sub> | V <sub>rec,1</sub> | M <sub>rec,1</sub> |
|-----------------|--------------------|--------------------|--------------------|--------------------|
| X-M6H, DNH 37   | 2.0 kN             | 0.6 kN             | 2.0 kN             | 5.5 kN             |
| X-M8H, X-DKH 48 | 3.0 kN             | 0.9 kN             | 3.0 kN             | 10.0 kN            |

#### Conditions

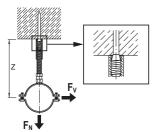

- N<sub>rec 1</sub>: concrete in compressive zone.
- N<sub>rec 2</sub>: concrete in tension zone.
- Predominantly static loading.
- Concrete C20/25–C50/60.
- A sufficient redundancy has to be ensured, that the failure of a single fastening will not lead to collapse of the entire system.
- Recommended loads are based on failure of the fastener anchorage in the concrete.
   Thickness and quality of the fastened material may lower the loadings.
  - Observance of all pre-drilling requirements, fastened thickness limits, and recommended details.
    - The recommended loads in the table refer to the resistance of the individual fastening and may not be the same as the loads  $F_N$  and  $F_V$  acting on the fastened part. Note: If relevant, prying forces need to be considered in design, see example. Moment acting on fastener shank only in case of a gap between base and fastened material.

 For more details in relation to base material properties, please refer to the chapter Fastener selection guide in the Direct Fastening Manual (DFTM).

#### Arrangements to prevent moment on shank

Coupler tight against concrete

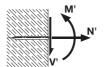

## Non-symmetric arrangement

- · Moment on fastened part
- Prying effect must be considered in determining loads acting on fastener

Resultant forces on nail

# **Application recommendation**

#### Base material thickness

X-M6H, DNH 37:  $h_{min} = 100 \text{ mm}$ X-M8H, X-DKH 48:  $h_{min} = 100 \text{ mm}$ 

#### Fastened material thickness

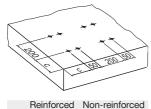

X-M6H:  $t_1 \le L_g - t_{washer} - t_{nut} \cong up \text{ to } 13.5 \text{ mm}$ X-M8H:  $t_1 \le L_g - t_{washer} - t_{nut} \cong up \text{ to } 14.0 \text{ mm}$ 

DNH 37: t<sub>1</sub> ≤ 2.0 mm

X-DKH 48:  $t_1 \le 5.0$  mm or  $t_1 \le 2.0$  by pre-drilling through fastened material

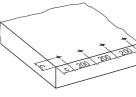

## Fastener positioning in base material

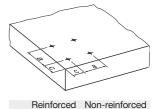

c 100 mm 150 mm

# Row along edge

Reinforced Non-reinforced
c 80 mm 150 mm

## General (e.g. group of fasteners

c 80 mm 150 mm a 80 mm 100 mm

#### **Corrosion information**

- The intended use only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

#### System recommendation

 For more details, please refer to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

# Cartridge recommendation

| Base material        | Cartridge color (tool power le | Cartridge color (tool power level) |  |  |  |  |
|----------------------|--------------------------------|------------------------------------|--|--|--|--|
|                      | Tool type:                     | Tool type:                         |  |  |  |  |
|                      | DX 6 F8                        | DX 5 F8, DX 460 F8, DX 2           |  |  |  |  |
|                      | Cartridge type: 6.8/11 M       | Cartridge type: 6.8/11 M           |  |  |  |  |
| Soft/medium concrete | titanium ■ (2-6)               | yellow <mark></mark> , red ■       |  |  |  |  |
| Tough concrete       | titanium ■ (4-8)               | yellow □, red ■                    |  |  |  |  |

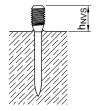

- Tool power level adjustment by setting tests on site.
- Start tool energy selection with lowest recommended tool power level.
  - Correct according requirement from chapter quality assurance.

#### **Quality assurance**

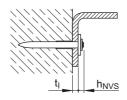

## Fastening inspection

## X-M6H, X-M8H

 $h_{NVS} = L - h_{ET}, h_{ET} = 37-41 \text{ mm}$ 

DNH 37, X-DKH 48

 $h_{NVS} \cong 4 \text{ mm}$ 

Place nails so that heads and washers bear tightly against each other and against the fastened material

#### Installation

## DNH 37, X-DKH 48

**DNH 37**

 $0.2 \text{ kN for h}_{\text{ET}} \ge 18 \text{ mm}$ 

# Arrangements to prevent moment on shank Coupler tight against concrete

## Non-symmetric arrangement

- Moment on fastened part
- Prying effect must be considered in determining loads acting on fastener

#### Conditions

- Minimum 5 fastenings per fastened unit (normal weight concrete)
- All visible failures must be replaced.
- With lightweight concrete base material and greater loading may be possible, please contact Hilti.
- · Predominantly static loading.
- Observance of all application limitations and recommendations.
- ullet The recommended loads in the table refer to the resistance of the individual fastening and may not be the same as the loads  $F_N$  and  $F_V$  acting on the fastened part.

Note: If relevant, prying forces need to be considered in design, see example. Moment acting on fastener shank only in case of a gap between base and fastened material.

• For more details in relation to base material properties, please refer to the chapter **Fastener selection guide** in the Direct Fastening Manual (DFTM).

## **Application recommendation**

#### Base material thickness

 $h_{min} = 80 \text{ mm } (d_{nom} = 3.7 \text{ mm})$ 

 $h_{min} = 100 \text{ mm } (d_{nom} \ge 4.5 \text{ mm})$ 

#### Fastened material thickness

 $t_l \le L_g - t_{washer} - t_{nut} \cong up \text{ to } 15 \text{ mm}$ M6:  $t_1 \le L_q - t_{washer} - t_{nut} \cong up \text{ to } 33 \text{ mm}$ W6: M8:  $t_1 \le L_q - t_{washer} - t_{nut} \cong up \text{ to } 15 \text{ mm}$ M10:  $t_1 \le L_q - t_{washer} - t_{nut} \cong up \text{ to } 19 \text{ mm}$ W10:  $t_1 \le L_q - t_{washer} - t_{nut} \cong up \text{ to } 25 \text{ mm}$ 

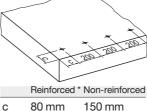

#### Fastener positioning in base material

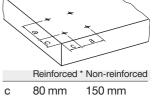

# Row along edge

80 mm 150 mm

# General (e.g. group of fasteners

80 mm 100 mm а

## Fastener shank length recommendation

#### Required thread length

 $L_a \ge t_l + t_{washer} + t_{nut} [mm]$ 

<sup>\*</sup> Minimum Ø 6 reinforcing steel continuous along all edges and around all corners. Edge bars must be enclosed by stirrups.

#### **Corrosion information**

- The intended use only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

#### System recommendation

 For more details, please refer to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

- Tool power level adjustment by setting tests on site.
- Start tool energy selection with lowest recommended tool power level.
- Correct according requirement from chapter quality assurance.

## **Quality assurance**

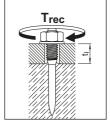

## Fastening inspection

# X-M6 / W6 Penetration depth

 $h_{NVS} = L_g \pm 2$ 

# Tightening torque

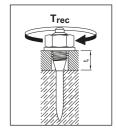

T<sub>rec</sub> ≤ 4 Nm

# X-M8, M10, W10 Penetration depth

 $h_{NVS} = L_g \pm 2$ 

# Tightening torque

T<sub>rec</sub> ≤ 6 Nm

#### **Application**

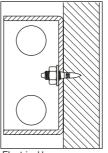

#### Example:

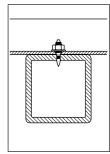

Base plates for pipe rings

Hanging with threaded couplers

Electrical boxes

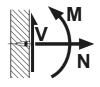

Miscellaneous attachments

#### Performance data

Recommended resistance under tension load, shear load and under bending moment

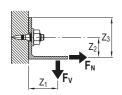

| Designation            | Shank                           | Tension load     | Shear load       | Bending          |

- Redundancy (multiple fastening) must be provided.
- Global factor of safety for static pull-out >3 (based on 5% fractile value).
- · Predominantly static loading.
- Strength of fastened material must be considered.
- Observance of all application limitations and recommendations.
- $\bullet$  The recommended loads in the table refer to the resistance of the individual fastening and may not be the same as the loads  $F_N$  and  $F_V$  acting on the fastened part.

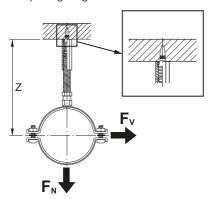

Note: If relevant, prying forces need to be considered in design, see example. Moment acting on fastener shank only in case of a gap between base and fastened material.

#### Arrangement to prevent moment on shank

#### Coupler tight against steel

#### Fastener positioning and base material

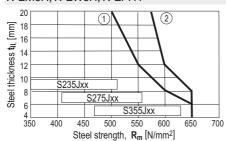

Edge distance:  $c \ge 15 \text{ mm}$ Spacing:  $s \ge 15 \text{ mm}$ 

#### **Application recommendation**

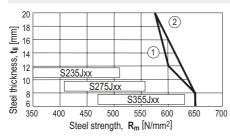

#### X-EM6H, X-EW6H, X-EF7H

- (1) Fastener:
  - X-EF7H-7-9 FP8 Setting tool: DX 6 F8, DX 5 F8, DX 460 F8
- (2) Fastener:
  - X-EM6H-8-9 FP8, X-EM6H-11-9 FP8, X-EM6H-20-9 FP8, X-EW6H-11-9 FP8, X-EW6H-20-9 FP8, X-EW6H-28-9 FP8, X-EW6H-38-9 FP8
  - Setting tool:

DX 6 F8, DX 5 F8, DX 460 F8

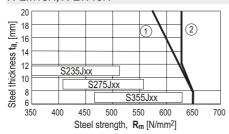

#### X-EM8H

- 1) Fastener:
  - X-EM8H-11-12 P8, X-EM8H-15-12 P8 Setting tool: DX 6 F8, DX 5 F8, DX 460 F8
- ② Fastener:

X-EM8H-15-12 FP10 Setting tool: DX 76, DX 76 PTR

#### X-EM10H, X-EW10H

1 Fastener:

X-EM10H-24-12 P10 Setting tool: DX 76, DX 76 PTR

② Fastener:

X-EW10H-30-14 P10 Setting tool: DX 600 N

• For more details, please refer to the chapter **Accessories and consumables compatibility** in the Direct Fastening Technology Manual (DFTM).

#### Material specifications

① Shank:

CR 500 (CrNiMo alloy) equivalent to A4 /
S31803 (1.4462) AISI grade 316 material
N 08926 (1.4529) Available on request

② Threaded sleeve: S31609

(X5CrNiMo 17-12-2+2H, 1.4401)

③ SN12-R washers: S 31635

(X2CrNiMo 17-12-2, 1.4404)

4 Sealing washers: Chloroprene rubber CR

3.1107, black\* Resistant to UV, salt water, water, ozone, oils, etc.

1) For High Corrosion Resistance HCR material inquire

Designation according to Unified Numbering System (UNS)

#### Recommended fastening tools

BX 3-BT / BTG DX 351-BT / BTG

 For more details, please refer to X-BT fastener program and to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

#### Approvals and certificates

ICC ESR-2347 (USA), ABS, LR, DNV-GL, BV 23498/B0, GL 12272-10HH, Russian Maritime Register

 Not all information presented in this product data sheet might be subject to approval/certificate content. Please refer to approval/certificate for further information.

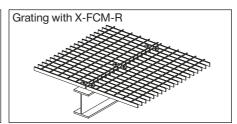

#### **Applications**

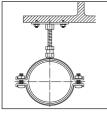

#### Examples

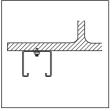

Threaded stud applications especially for:

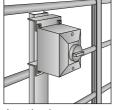

- · High strength steel
- · Coated steel structures
- Through penetration of base steel is not allowed

Base plates

Installation rails

Junction box, etc.

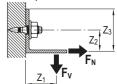

#### Performance data

#### Recommended loads - Steel

| Steel grade:<br>Europe, USA |                            | S235,<br>A36 | S355, Grade 50<br>and stronger steel |
|-----------------------------|----------------------------|--------------|--------------------------------------|
| Tension,                    | N <sub>rec</sub> [kN/lb]   | 1.8 / 405    | 2.3 / 517                            |
| Shear,                      | V <sub>rec</sub> [kN/lb]   | 2.6 / 584    | 3.4 / 764                            |
| Moment,                     | M <sub>rec</sub> [Nm/lbft] | 8.2 / 6      | 8.2 / 6                              |
| Torque,                     | T <sub>rec</sub> [Nm/lbft] | 8/5.9        | 8/5.9                                |
|                             |                            |              |                                      |

Example:

#### Recommended loads - cast iron \*

| Tension, | N <sub>rec</sub> [kN/lb]   | 0.5 / 115<br>0.75 / 170 |
|----------|----------------------------|-------------------------|
| Shear,   | V <sub>rec</sub> [kN/lb]   | 0.75 / 170              |
| Moment,  | M <sub>rec</sub> [Nm/lbft] | 8.2 / 6                 |

#### Conditions for recommended loads:

- Global factor of safety for static pull-out > 3 (based on 5% fractile value)
- Minimum edge distance = 6 mm [1/4"].
   Effect of base metal vibration and stress considered.
- · Redundancy (multiple fastening) must be provided.
- The recommended loads in the table refer to the resistance of the individual fastening and may not be the same as the loads FN and FV acting on the fastened part. Note: If relevant, prying forces need to be considered in design, see example. Moment acting on fastener shank only in case of a gap between base and fastened material.

| V-N-M (shear, tension and bending)                   | $\frac{V}{V_{rec}} + \frac{N}{N_{rec}} + \frac{M}{M_{rec}} \le 1.0$  |  |  |

- Cyclic loading:
   Anchorage of X-BT-R threaded stud in steel base material is not affected by cyclic loading.
- Fatigue strength is governed by fracture of the shank. Inquire at Hilti for test data if high cycle loading has to be considered in the design.

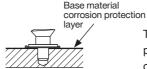

#### **Application recommendation**

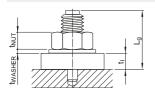

#### Thickness of base material

Thickness of base material corrosion protection layer ≤ 0.4mm. For thicker coatings, please contact Hilti.

#### Thickness of fastened material

 $\begin{array}{lll} X\text{-BT M8:} & 2.0 \le t_l \le 7.0 \text{ mm} \\ X\text{-BT M10} / X\text{-BT W10:} & 2.0 \le t_l \le 15.0 \text{ mm} \\ X\text{-BT M6} / X\text{-BT W6:} & 1.0 \le t_l \le 14.0 \text{ mm} \end{array}$ 

Note:

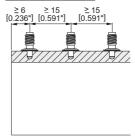

For X-BT with SN 12R sealing washer  $t_l \ge 2.0$  mm For X-BT M6 / W6 with SN 12R sealing washer  $t_l \ge 1.0$  mm

#### Spacing and edge distances

#### Edge distance: ≥ 6 mm

#### Spacing: ≥ 15 mm

#### Application limit

- $t_{II} \ge 8 \text{ mm} [5/16] \rightarrow \text{No through penetration}$
- No limits with regards to steel strength

#### **Corrosion information**

The corrosion resistance of Hilti CR500 and S31803 (1.4462) stainless steel material is equivalent to AISI 316 (A4) steel grade.

Studs made of N 08926 (HCR) material with higher corrosion resistance, e.g. for use in road tunnels or swimming pools, are available on special order.

#### Fastener program and system recommendation

#### Fastener program

| X-BT W10-24-6 SN12-R    | 377076   | BX 3-BT, DX 351-BT   |
| X-BT W10 without washer | 377075   | BX 3-BT, DX 351-BT   |
| X-BT M6-24-6 SN12-R     | 432266   | BX 3-BT, DX 351-BT   |
| X-BT W6-24-6 SN12-R     | 432267   | BX 3-BT, DX 351-BT   |

Note: For High Corrosion Resistance HCR material inquire at Hilti

#### Cartridge recommendation

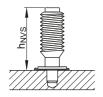

6.8/11 M high precision brown cartridge

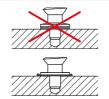

- Tool power level adjustment by setting tests on site.
- Correct according requirement from chapter quality assurance.

#### **Quality assurance**

#### Fastening inspection

X-BT M8

 $h_{NVS} = 15.7-16.8 \text{ mm}$ 

X-BT M10 / X-BT W10 and X-BT M6 / X-BT W6 h<sub>NVS</sub> = 25.7–26.8 mm

#### Installation

#### X-BT with washer

Fastened material hole ∅ ≥ 13 mm

#### X-BT M6 / X-BT W6

Fastened material with pre-drilled hole diameter < 7 mm

Fastened material with pre-drilled hole diameter ≥ 7 mm

Pre-drill with TX-BT 4/7 step shank drill bit

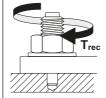

Tighten using a screwdriver with torque clutch

Pre-drill until the shoulder grinds a shiny ring (to ensure proper drilling depth)

Tightening torque: T<sub>rec</sub> ≤ 8 Nm (5.9 ft-lb)!

Hilti Torque tool X-BT 1/4"

Before fastener installation:

the drilled hole must be clear of liquids and debris. The area around the drilled hole must be free from liquids and debris.

| Hilti        | Torque   |
|--------------|----------|
| screwdriver: | setting: |
| SF 121-A     | 11       |
| SF 150-A     | 9        |
| SF 180-A     | 8        |
| SF 144-A     | 9        |
| SF 22A       | 9        |
| SFC 22-A     | 5        |
| SBT 4-A22    | 5        |

These are abbreviated instructions which may vary by application. **ALWAYS** review/follow the instructions accompanying the product.

X-BT-MR M6/10 SN 8 X-BT-MR W6/10 SN 8

X-BT-GR M8/7 SN 8

#### Features and benefits

The X-BT system is an approved Fastening on Steel system for grating and multi-purpose fastening applications. Benefits include no-rework to backside of base material, not having application limits and capability to work in C5 corrosive environment. The new generation X-BT system has increased load performance compared with the previous X-BT.

#### Material specifications

① Shank and thread: \$31803 (1.4462)

equivalent to A4 / AISI grade 316 material

② SN washer: S 31635

(X2CrNiMo 17-12-2, 1.4404)

③ Sealing washer: Elastomer, black, resistant

to UV, salt water, water,

ozone.oils. etc.

Guiding sleeve: Plastic

⑤ Flange nut: A4 / AISI grade 316 material

Designation according to Unified Numbering System (UNS)

#### Recommended fastening tools

BX 3-BT / BTG DX 351-BT / BTG

 For more details, please refer to X-BT-GR/-MR fastener program and to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

#### Approvals and certificates

ETA-20/1042, ABS 18-HS1755518, DNV-GL TAS00001SV, BV 54554, LR 19/0003, ICC-ES ESR-2347 (USA)

 Not all information presented in this product data sheet might be subject to approval/certificate content. Please refer to approval/certificate for further information.

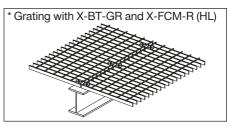

#### **Applications**

#### Examples

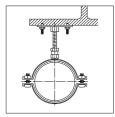

Threaded stud applications especially for: ø4.7

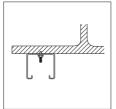

- High strength steel
- Coated steel structures
- Through penetration of base steel is not allowed

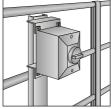

<sup>\*</sup> Load data, application requirements, corrosion information, fastener selection, system recommendation, material specification and coating refer to section X-FCM-R, X-FCM-R HL or X-FCS-R Grating Fastening System in the Direct Fastening Technology Manual

#### Multi purpose fastening with X-BT-MR

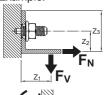

Junction box, etc.

#### Performance data - Construction steel

#### Recommended loads - steel base material

| Steel grade:<br>Europe, USA | <b>A</b>                   | S235, S275<br>A36 | S355 to S960<br>≥ Grade 50 |

| Torque,                     | T <sub>rec</sub> [Nm/lbft] | 20.0 / 14.8       | 20.0 / 14.8                |

#### Example:

#### Conditions for recommended loads:

- Application of working load design concept (e.g. ASD)
- For unalloyed construction, off-shore and Shipbuilding steel: e.g. European grades S235, S275, S355 according to EN 10025-2, S355M, S420M, S460M according to EN 10025-4 or EN 10225, S690Q and S960Q according to EN10025-6, US steel grade A36 and Grade 50.
- Minimum base material thickness t<sub>II</sub> = 8 mm.
- Applicable for steel base materials up to a coating thickness of 500 µm.
- Edge distance c ≥ 10 mm [3/8"].
- In case of edge distance 6 mm  $\leq$  c < 10 mm, N<sub>rec</sub>, V<sub>rec</sub> and M<sub>rec</sub> need to be reduced with the reduction factor  $\alpha_c$  = 0.65.
- For group fastenings with up to 4 fasteners per group and shear force introduction via the sealing washer,
  - the resistance of all fasteners can be added up, provided the hole in the fastened material is equal or less than 14 mm (e.g.  $V_{rec,group} = 17.2$  kN for a group with 4 fasteners fixed to S235 base material). For more details see "New Generation Hilti X-BT-GR, X-BT-MR and X-BT-ER Threaded Fastener Specification".
- Redundancy (multiple fastening) must be provided.

#### Remarks:

- The recommended loads in the table refer to the resistance of the single fastener and need to be determined by static analysis from the loads F<sub>N</sub> and F<sub>V</sub> acting on the fastened part.
   Typical example is the need of consideration of prying forces, see example.
- Moments acting on the shank only need to be considered in case of a gap between the base and the fastened material.
- Global factor of safety for tension and shear load = 2.8 related to the characteristic resistance  $N_{\rm Rk}$  and  $V_{\rm Rk}$
- Global factor of safety for bending moment = 1.75 related to the characteristic bending moment M<sub>B k</sub> of the shank.
- Effects of base metal vibration and stresses are considered.
- For difference of form and friction lock for shear resistance, refer to explanations ate the end of this data sheet.

### Recommended interaction formula for combined loading - steel and cast iron base material Load combination Interaction provison

V–N (shear and tension)  $\frac{V_{Sd}}{V_{Rd}} + \frac{N_{Sd}}{N_{Rd}} \le 1.2 \text{ with } \frac{V_{Sd}}{V_{Rd}} \le 1.0 \text{ and } \frac{N_{Sd}}{N_{Rd}} \le 1.0$ 

V-M (shear and bending)  $\frac{V_{Sd.}}{V_{Rd.}} + \frac{M_{Sd.}}{M_{Rd.}} \le 1.2 \text{ with } \frac{V_{Sd.}}{V_{Rd.}} \le 1.0 \text{ and } \frac{M_{Sd.}}{M_{Rd.}} \le 1.0$ 

N–M (tension and bending)  $\frac{N_{Sd.}}{N_{Rd}} + \frac{M_{Sd.}}{M_{Rd}} \le 1.0$ 

V-N-M (shear, tension and bending)  $\frac{V_{Sd}}{V_{Rd}} + \frac{N_{Sd}}{N_{Rd}} + \frac{M_{Sd}}{M_{Rd}} \le 1.0$ 

#### Cyclic loading:

- Anchorage of X-BT threaded stud in steel base material is not affected by cyclic loading.
- Fatigue strength is governed by fracture of the shank. For more details see "New Generation Hilti X-BT-GR, X-BT-MR and X-BT-ER Threaded Fastener Specification".

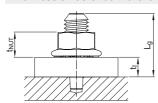

#### **Application recommendation**

Application limit and thickness of base material

 $t_{||} \ge 8 \text{ mm } [5/16"] \rightarrow \text{No through-penetration.}$ No limits with regard to steel strength.

#### Thickness of fastened material

 X-BT-GR M8:
  $2.0 \le t_l \le 7.0 \text{ mm}$  

 X-BT-MR M10/W10:
  $2.0 \le t_l \le 15.0 \text{ mm}$  

 X-BT-MR M8:
  $2.0 \le t_l \le 14.0 \text{ mm}$  

 X-BT-MR M6/W6:
  $2.0 \le t_l \le 10.0 \text{ mm}^*$ 

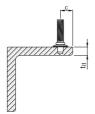

\* if base material sits on the collar of the stud t<sub>l.min</sub> = 1.0 mm

#### Spacing and edge distances

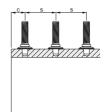

#### Edge distance:

c  $\geq$  10 mm (load reduction factor  $\alpha_c$  = 1.00)

6 mm  $\leq$  c < 10 mm (load reduction factor  $\alpha_c$  = 0.65)

Spacing: s ≥ 15 mm

#### **Corrosion information**

The corrosion resistance of S31803 (1.4462) stainless steel material is equivalent to AISI 316 (A4) steel grade. For detailed information see "New Generation Hilti X-BT-GR, X-BT-MR and X-BT-ER Threaded Fastener Specification".

#### Fastener program and system recommendation

#### Fastener program

| Designation         | Item no. | Tool<br>Designation  |
|---------------------|----------|----------------------|
| X-BT-GR M8/7 SN 8   | 2194344  | BX 3-BTG, DX 351-BTG |
| X-BT-MR M6/10 SN 8  | 2252199  | BX 3-BT, DX 351-BT   |
| X-BT-MR M6/14 SN8   | 2194337  | DX 351-BT            |
| X-BT-MR W6/10 SN 8  | 2252470  | BX 3-BT, DX 351-BT   |
| X-BT-MR W6/14 SN 8  | 2194338  | DX 351-BT            |
| X-BT-MR M8/14 SN 8  | 2194339  | BX 3-BT, DX 351-BT   |
| X-BT-MR M10/15 SN 8 | 2194340  | BX 3-BT, DX 351-BT   |
| X-BT-MR W10/15 SN 8 | 2194341  | BX 3-BT, DX 351-BT   |

#### Cartridge selection and tool energy setting

DX 351-BTG, DX 351-BT: 6.8/11 M high precision brown cartridge

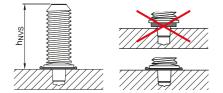

Battery selection and fastener guide adjustment

BX 3-BT, BX 3-BTG: 22 V cordless tool battery platform Battery recommendation: B 22/2.6, also allowed B 22/3.0, B 22/4.0, B 22/5.2

The recommended fastener guide position is "1" (if required, adjust the fastener guide position based on job site tests and IFU).

#### **Quality assurance**

#### Fastening inspection

X-BT-GR M8

 $h_{NVS} = 15.7-16.8 \text{ mm}$ 

X-BT-MR M6/W6/M8/M10/W10

 $h_{NVS} = 25.7-26.8 \text{ mm}$ 

#### Installation recommendation

#### X-BT-MR M8

Fastened material:

- Hole diameter: 13 to 14 mm: Use of supplied flange nut ①
- Hole diameter: beyond 14 to 18 mm: Use of supplied flange nut with supplement washer (maximum thickness of fixed component to be reduced with thickness of washer) (2)

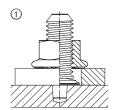

Fastened material:

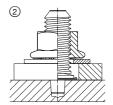

- Hole diameter: 13 to 18 mm: Use of supplied flange nut (1)
- Hole diameter: beyond 18 to 22 mm: Use of supplied flange nut with supplement washer (maximum thickness of fixed component to be reduced with thickness of washer) (2)

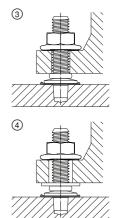

#### X-BT-MR M6/W6

Fastened material:

- Hole diameter: 6.5 6.7: Fastener sits on collar of stud, use of supplied flange nut ③
- Hole diameter: 6.7 to 11 mm: Use of supplied flange nut with supplement washer sitting on collar 4
- Hole diameter: > 12 mm, fixed part sits on base material, use of flange nut with supplemental washer to cover hole clearance (maximum thickness of fixed component to be reduced with thickness of washer) ②

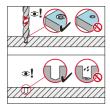

#### Remarks on group fastenings

For group fastenings with up to 4 fasteners per group and shear force introduction via the sealing washer, the resistance of all fasteners can be added up, provided the hole in the fastened material is equal or less than 14 mm. For detailed information see "New Generation Hilti X-BT-GR, X-BT-MR and X-BT-ER Threaded Fastener Specification".

#### Pre-drill

- Pre-drill with TX-BT 4.7/7 step shank drill bit.
- Pre-drill until shoulder grinds a shiny ring.
- The drill hole and the area around drilled hole must be clean and free from liquids and debris.

These are abbreviated instructions which may vary by application.

**ALWAYS** review/follow the instructions accompanying the product.

| Tightening torque |                            |
|-------------------|----------------------------|
|                   | Fastener: X-BT-GR, X-BT-MR |

#### Tightening tool recommendation for tightening with cordless screwdriver

| Cordless    | Clutch type      | Gear | Clutch |
|-------------|------------------|------|--------|
| screwdriver | (stop detection) |      |        |
| SF 6-A22    | ESC (HJ)         | 1    | 5      |
| SF 6H-A22   | ESC (HJ)         | 1    | 5      |
| SF 10W-A22  | TRC              | 4    | 11     |
| SF 8M-A22   | TRC              | 4    | 11     |
| SFC 14-A    | TRC              | 2    | 11     |
| SFC 22-A    | TRC              | 2    | 11     |

Tool power level adjustment:

Gear:

Clutch:

- The setting of the torque via the Hilti screwdriver with torque release coupling (TRC) can change as the clutch wears over time. The specified torque setting is only a rough guide value and applies to a new Hilti screwdriver.
- To ensure recommended torque is applied, Hilti recommends the use of a calibrated torque wrench or the Hilti torque tool.
- The specified torque setting for the Hilti screw drivers with electronic slip clutch (ESC) is only a rough guide value as the ESC has 2 stop detections; Soft Joint (SJ) detection and Hard Joint (HJ) detection. The hard joint detection is activated due to drop in speed (fast stop) and can lead to a torque spike. The installation torque may vary depending on the user and the application. To ensure recommended torque is applied, Hilti recommends the use of a calibrated torque wrench or the Hilti torque tool.

Tightening tool recommendation for tightening with Hilti torque tool

Hilti torque tool

Torque tool X-BT 1/4" - 20 Nm

#### Form and friction lock for shear connection

Shear load transfer via friction lock is relevant if non-slip connections are required in the service state

- Fixing the position of channel sections with slotted holes and forces in direction of the slots
- Connections with hole clearance beyond 14 mm

Slotted holes or bigger hole clearance allow easier assembly and geometric adjustment of the fixed component. Consequently form lock mechanism by means of direct contact of the fixed component with the washer of the X-BT-MR cannot be easily ensured with little slip in those cases. The New Generation X-BT-MR fasteners allow the use higher torque of 20 Nm resulting in a friction shear connection capacity. That friction lock can be utilized to fix the position of the attached component as well as for shear load transfer if the demand is comparably small. In case of high shear demand, the form lock mechanism has to be actived and can further be optimized for group fastenings (for more details on group fastenings relying on form lock, see "New Generation Hilti X-BT-GR, X-BT-MR and X-BT-ER Threaded Fastener Specification")

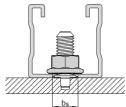

#### Examples of friction lock

MQ-41 channel with X-BT-MR M10/15 SN 8 and varying distances e<sub>1</sub> and e<sub>2</sub>

Is ... length of the slot (50 mm)

bs ... width of the slot (14 mm)

#### X-BT-MR connections with maximum hole diameter in fixed material

X-BT-MR M8/14 SN 8, max. hole  $\emptyset$  = 18 mm

X-BT-MR M10/15 SN 8, max. hole  $\emptyset$  = 22 mm

#### Conditions and remarks

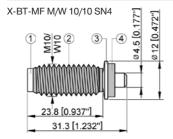

- The use of friction lock connection forces requires the application of an installation torque
   T = 20 Nm.
- Friction lock not suitable in case of base material vibrations.
- The friction lock values are suitable to fix the position of components and in case of lower shear load demand. Full shear load capacity are developed by means of form lock via contact of the fixed component with the sealing washer of the X-BT-MR.

#### Performance data

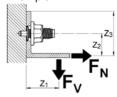

Recommended loads

For structural steel (ultimate strength of base material R<sub>m</sub> ≥ 350 MPa)

| Service temperature      |                  | -40°C to +60°C /                                       | +60°C to +100°C / |  |
|--------------------------|------------------|--|-------------------|--|
|                          |                  | -40°F to +140°F  | +140°F to 212°F   |  |
| Tension                  | N <sub>rec</sub> | 1.5 kN / 340 lb  | 1.0 kN / 225 lb   |  |
| Shear                    | $V_{rec}$        | 2.2 kN / 500 lb  | 1.4 kN / 315 lb   |  |
| Moment                   | M <sub>rec</sub> | 8.2 Nm / 6 lbft  | 8.2 Nm / 6 lbft   |  |
| Torque                   | T <sub>rec</sub> | $\leq$ 8 Nm / $\leq$ 5.9 lbft $\leq$ 8 Nm / $\leq$ 5.9 |                   |  |
|                          |                  |  |                   |  |
| During insta             | allation         |  |                   |  |
| In service temp. range   |                  | -40°C to +100°C / -40°F to +212°F                      |                   |  |
| Installation temperature |                  | -10°C to +60°C / 14°F to 140°F                         |                   |  |

Example:

#### Conditions for recommended loads:

- Use with Hilti glass-fiber reinforced polyamide material nuts, M10 and W10 (2) according to General Information - Material specifications)
- Not to be used with any additional washer which provide an axial force when deformed,
   e.g. spring or lock washer, etc.
- Global factor of safety > 3 (based on 5% fractile value)
- Minimum edge distance = 6 mm [1/4"].
- Effect of base metal vibration and stress considered.
- Redundancy (multiple fastening) must be provided.
- The recommended loads in the table refer to the resistance of the individual fastening and may not be the same as the loads F<sub>N</sub> and F<sub>V</sub> acting on the fastened part.
   Note: If relevant, prying forces need to be considered in design, see example. Moment acting on fastener shank only in case of a gap between base and fastened material.
- Minimum temperature for installation and adjustments = -10°C

#### Design loads

For structural steel (ultimate strength of base material R<sub>m</sub> ≥ 350 MPa)

| Service temperature      |          | -40°C to +60°C/                   | +60°C to +100°C /   |  |
|--------------------------|----------|-----------------------------------|---------------------|--|

# Recommended interaction formula for combined loading Combined loading situation Interaction formula V–N (shear and tension) $\frac{V}{V_{rec}} + \frac{N}{N_{rec}} \le 1.2 \text{ with } \frac{V}{V_{rec}} \le 1.0 \text{ and } \frac{N}{N_{rec}} \le 1.0$ V–M (shear and bending) $\frac{V}{V_{rec}} + \frac{M}{M_{rec}} \le 1.2 \text{ with } \frac{V}{V_{rec}} \le 1.0 \text{ and } \frac{M}{M_{rec}} \le 1.0$ N–M (tension and bending) $\frac{N}{N_{rec}} + \frac{M}{M_{rec}} \le 1.0$ V–N–M (shear, tension and bending) $\frac{V}{V_{rec}} + \frac{N}{N_{rec}} + \frac{M}{M_{rec}} \le 1.0$

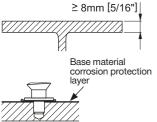

#### Cyclic loading

- Anchorage of X-BT-MF threaded stud in steel base material is not affected by cyclic loading.
- Fatigue strength is governed by fracture of the shank. Inquire at Hilti for test data if high cycle loading has to be considered in the design.

#### Application recommendation

#### Thickness of base material

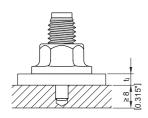

Where through penetration is not allowed\*

Thickness of base material corrosion protection layer
≤ 0.4mm. For thicker coatings, please contact Hilti.

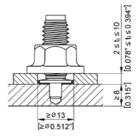

\*Note: Corrosion protection may be compromised if base material thickness is less than 8mm.

Please contact Hilti for load recommendations if base material thickness is less than 8mm and through penetration allowed.

#### Thickness of fastened material

 $2.0 \le t_i \le 10.0 \text{ mm}$  $0.08'' \le t_i \le 0.39''$ 

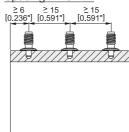

Fastened material hole ∅ ≥ 13mm (0.51")

#### Spacing and edge distances

#### Edge distance: ≥ 6 mm

#### Spacing: ≥ 15 mm

#### Application limit

- t<sub>II</sub> ≥ 8 mm [<sup>5</sup>/<sub>16</sub>] → No through penetration
- No limits with regards to steel strength

#### **Durability**

From a durability point of view, it can be assumed that the Hilti X-BT-MF system will have a lifetime over 20 years even in mildly corrosive environment (C3 environment according to EN-ISO 12944-2).

#### **Corrosion information**

For fastenings exposed to outdoor environments in mildly corrosive conditions where HDG coated parts are commonly specified or used.

Not for use in atmospheres with chlorides (marine atmospheres) or in heavily polluted environments (e.g. sulphur dioxide).

#### Vibration (Transportation, handling and base material vibration)

When installed according to instruction for use and fastening quality assurance, the X-BT-MF system (stud and Hilti glass-fiber reinforced polyamide material nuts) is resistant to transportation, handling and base material vibration.

The use of additional lock washer is not required. Lock washer will affect the integrity and functionality of the Hilti glass-fiber reinforced polyamide material nuts. Therefore additional lock or spring washers must not be used in combination with the X-BT-MF system. For more information regarding vibration, please refer to "X-BT-MF Additional Technical Information".

#### Cartridge selection and tool energy setting

6.8/11 M high precision brown cartridge

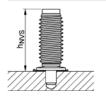

- Tool power level adjustment by setting tests on site.
- Start tool energy selection with lowest recommended tool power level.
- · Correct according requirement from chapter quality assurance.

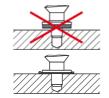

#### **Quality assurance**

#### Fastening inspection

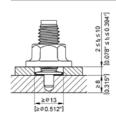

X-BT-MF

h<sub>NVS</sub> = 25.7–26.8 mm = 1.012"–1.055"

#### Installation recommendation

Fastened material hole  $\emptyset \ge 13 \text{ mm } (0.51")$ 

Remark: for group fastenings subjected to shear loading the fastened material hole diameter should not exceed 14mm

#### Pre-drill

- Pre-drill with TX-BT 4/7 step shank drill bit.
- Pre-drill until the shoulder grinds a shiny ring (to ensure proper drilling depth).
- Before fastener installation: the drilled hole and the area around the drilled hole must be clear of liquids and debris.

These are abbreviated instructions which may vary by application.

**ALWAYS** review/follow the instructions accompanying the product.

| Tightening torque |                   |
|-------------------|-------------------|
|                   | Fastener: X-BT-MF |

• Tool power level adjustment:

Gear:

Clutch:

- The setting of the torque via the Hilti screwdriver with torque release coupling (TRC) can change as the clutch wears over time. The specified torque setting is only a rough guide value and applies to a new Hilti screwdriver.
   To ensure recommended torque is applied, Hilti recommends the use of a calibrated torque wrench or the Hilti torque tool.
- The specified torque setting for the Hilti screw drivers with electronic slip clutch (ESC) is only a rough guide value as the ESC has 2 stop detections; Soft Joint (SJ) detection and Hard Joint (HJ) detection. The hard joint detection is activated due to drop in speed (fast stop) and can lead to a torque spike. The installation torque may vary depending on the user and the application. To ensure recommended torque is applied, Hilti recommends the use of a calibrated torque wrench or the Hilti torque tool.

# Tightening tool recommendation for tightening with Hilti torque tool Hilti torque tool Torque tool X-BT 1/4" – 8 Nm

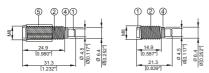

# X-BT-MR-N Stainless steel threaded stud for narrow through hole

#### **Product data**

#### **Dimensions**

X-BT-MR-N M8/14 N 4 X-BT-MR-N M8/4 N 4

Note on drill-bit:

X-BT-MR-N requires the use of the specific drill bit TX-BT 4/5.5. The drill bit TX-BT 4/7, which is used for X-BT, X-BT-MF and X-BT-ER fasteners must not be used for X-BT-MR-N studs.

#### Material specifications

#### Conditions for recommended loads

- Global factor of safety for static pull-out > 3 (based on 5% fractile value)
- Minimum edge distance = 6 mm [1/4"].
- Effect of base metal vibration and stress considered.
- Redundancy (multiple fastening) must be provided.
- The recommended loads in the table refer to the resistance of the individual fastening and may not be the same as the loads FN and FV acting on the fastened part. Note: If relevant, prying forces need to be considered in design, see example. Moment acting on fastener shank only in case of a gap between base and fastened material.

|                                    |  |
| N-M (tension and bending)          | $\frac{N}{N_{\text{rec}}} + \frac{M}{M_{\text{rec}}} \le 1.0$  |
| V-N-M (shear, tension and bending) | $\frac{V}{V_{rec}} + \frac{N}{N_{rec}} + \frac{M}{M_{rec}} \le 1.0$  |

# Cyclic loading

- Anchorage of X-BT-MR-N threaded stud in steel base material is not affected by cyclic loading.
- Fatigue strength is governed by fracture of the shank. Inquire at Hilti for test data if high cycle loading has to be considered in the design.

# **Application recommendation**

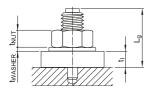

#### Thickness of base material

Base material corrosion protection layer

Thickness of base material corrosion protection layer ≤ 0.4mm. For thicker coatings, please contact Hilti.

#### Thickness of fastened material

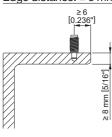

X-BT-MR-N M8/4 N 4:  $t_1 \le 4 \text{ mm}$ 

X-BT-MR-N M8/14 N 4:  $4mm \le t_1 \le 14mm$ 

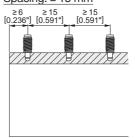

For thickness less than 4 mm, reduction of shear loading is required, please contact Hilti.

# Spacing and edge distances

#### Edge distance: ≥ 6 mm

# Spacing: ≥ 15 mm

### Application limit

- t<sub>II</sub> ≥ 8 mm [<sup>5</sup>/<sub>16</sub>"] → No through penetration
- No limits with regards to steel strength

# **Corrosion information**

The corrosion resistance of Hilti CR500 and S31803 stainless steel material is equivalent to AISI 316 (A4) steel grade.

# Fastener program and system recommendation

### Fastener program

#### Conditions for recommended loads and design loads:

- Use S-BT-MR and S-BT-MF (multipurpose fastening) only with the supplied Hilti serrated flange nuts M8, M10, W10 (⑤ or ⑥ as per according to General Information – Material specifications)
- Global factor of safety  $\Omega$  resp. partial factor of safety  $\gamma_m$  (based on 5 % fractile ultimate test value)

|                 | Recommended loads | Design loads |
|-----------------|-------------------|--------------|
| static pull-out | 2.80              | 2.00         |
| static shear    | 2.80              | 2.00         |
| Bending         | 1.75              | 1.25         |

- Minimum edge distance = 6 mm [0.24"], minimum spacing ≥ 18 mm [0.709"]
- Effect of base metal vibration and stress (e.g. areas with tensile stress) considered.
- Redundancy (multiple fastening) must be provided.
- If eccentric loading exists (e.g. use of an angle clip), moments caused by off-center loading must be considered.

# Cyclic loading

S-BT threaded studs are only to be used for fastenings subject to static or quasi-static loading. Inquire at Hilti for test data if cyclic loading has to be considered in the design.

# Recommended interaction formula for combined loading

V–N (shear and tension) 
$$\frac{V}{V_{rec}} + \frac{N}{N_{rec}} \le 1.0 \text{ with } \frac{V}{V_{rec}} \le 1.0 \text{ and } \frac{N}{N_{rec}} \le 1.0$$

V–M (shear and bending) 
$$\frac{V}{V_{rec}} + \frac{M}{M_{rec}} \le 1.0 \text{ with } \frac{V}{V_{rec}} \le 1.0 \text{ and } \frac{M}{M_{rec}} \le 1.0$$

N–M (tension and bending) 
$$\frac{N}{N_{rec}} + \frac{M}{M_{rec}} \le 1.0$$

V–N–M (shear, tension and bending) 
$$\frac{V}{V_{mo}} + \frac{N}{N_{mo}} + \frac{M}{M_{mo}} \le 1.0$$

#### **Corrosion information**

The S-BT stainless steel fasteners are made from the duplex stainless steel type 1.4462, which is equivalent to AISI 316 (A4) steel grade. This grade of stainless steel is classified in the corrosion resistance class IV according to DIN EN 1993-1-4:2015, which makes the material suitable for aggressive environments like in coastal and offshore applications.

The microstructures of duplex stainless steels consist of a mixture of austenite and ferrite phases. Compared to the austenitic stainless steel grades, duplex stainless steels are magnetic. The surface of the S-BT stainless steel fasteners is zinc-coated (anti-friction coating) in order to reduce the thread forming torque when the stud is screwed in into the base material.

The coating of the carbon steel S-BT fasteners consists of an electroplated Zn-alloy for cathodic protection and a top coat for chemical resistance (Duplex-coating). The thickness of the coating is  $35 \, \mu m$ . The use of this coating is limited to the corrosion category C1, C2 and C3 according the standard EN ISO 9223. For higher corrosion categories stainless steel fasteners should be used.

In case of a drill through hole or a pilot hole in thin base material, rework of the coating on the back side of the plate/profile may be needed.

**Note:** ETA-20/0530 allows the use of carbon steel threaded studs with duplex coating only in dry indoor environment (C1 acc. to EN ISO 9223).

#### Fastener quality assurance

S-BT-MF W 10/15 AN 6

In order to ensure the exact screw-in depth and a proper compressed sealing washer, the S-BT studs have to be installed with the appropriate depth gauge. With this tool the screw-in depth can be adjusted in a range of 0–1.5 mm (3 steps, 0.5mm per step).

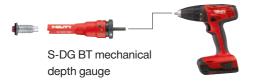

The S-CC BT calibration card is needed to check the initial stand-off of the S-BT stud and to adjust/calibrate the S-DG BT depth gauge. After finding the right adjustment level for the S-DG BT depth gauge, the gauge can be adjusted and the studs can be installed without additional check of the S-DG BT depth gauge.

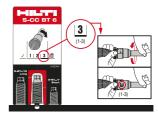

The depth gauge has to be re-adjusted (calibrated) at following times:

- Start of the installation process
- Change of the working position (upwards, downwards, horizontal) and base material (thickness, strength, type)
- Installer change
- · After each packaging respectively after the installation of 100 S-BT studs

The lifetime of the S-DG BT depth gauge is ≥ 1000 settings.

Design and functionality of the mechanical calibration card S-CC BT

# **Fastening inspection**

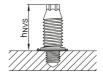

The installer is responsible for the correct setting of the S-BT studs. For the periodical verification of the correct stud stand-off the S-CG BT check gauge can be used.

Design and functionality of the check gauge S-CG BT

S-BT-\_\_\_\_/15\_\_\_\_6  $h_{NVS} = 29.3 \text{ mm to } 29.8 \text{ mm}$ [1.153" to 1.173"]

#### Installation recommendation

# S-BT fasteners made of stainless steel with washer-Ø 12 mm (S-BT-\_R)

Fastened material hole Ø ≥ 13 mm [0.51"]

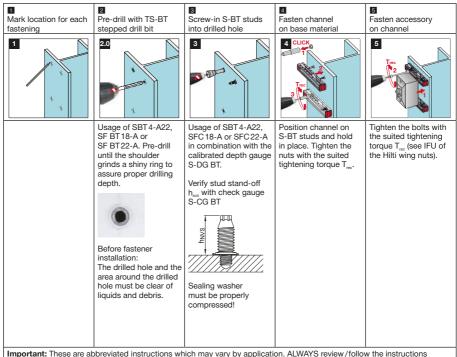

# S-BT fasteners made of carbon steel with washer-Ø 10 mm (S-BT-\_F)

Fastened material hole Ø ≥ 11 mm [0.43"]

#### Important:

For group fastenings subjected to shear loading the fastened material hole diameter should not exceed 14 mm [0.55"] (S-BT-\_R) and 12 mm [0.47"] (S-BT-\_F) respectively.

Important: These are abbreviated instructions which may vary by application. ALWAYS review/follow the instructions for use (IFU) accompanying the product. In case of a drill through hole, rework of the coating on the back side of the plate/profile may be needed.

| SFC 22-A    | TRC              | 1    | 5      |

Tool power level adjustment:

Gear:

Clutch:

- The setting of the torque via the Hilti screwdriver with torque release coupling (TRC) can change as the clutch wears over time. The specified torque setting is only a rough guide value and applies to a new Hilti screwdriver.
   To ensure recommended torque is applied, Hilti recommends the use of a calibrated torque wrench or the Hilti torque tool.
- The specified torque setting for the Hilti screw drivers with electronic slip clutch (ESC) is only a rough guide value as the ESC has 2 stop detections; Soft Joint (SJ) detection and Hard Joint (HJ) detection. The hard joint detection is activated due to drop in speed (fast stop) and can lead to a torque spike. The installation torque may vary depending on the user and the application. To ensure recommended torque is applied, Hilti recommends the use of a calibrated torque wrench or the Hilti torque tool.

#### Tightening tool recommendation for tightening with Hilti torque tool

Hilti torque tool

Torque tool X-BT 1/4" - 8 Nm

Tightening torque for fastening to aluminum base material and in steel base material 3 mm  $\leq$   $t_u$  < 5 mm (drill through hole)

#### Tightening tool recommendation for tightening with Hilti torque tool

Hilti torque tool

Torque tool S-BT 1/4" - 5 Nm

|   | S-BT-MR, S-BT-MF, S-BT-GR, S-BT-GF |                           |                                      |                         |                           |
|---|------------------------------------|---------------------------|--------------------------------------|-------------------------|---------------------------|
| Base material thickness   | t > 5 mm   0 20"   1               |                           |                                      | n [0.12"]<br>mm [0.20"] |                           |
| Base material type  | Steel<br>S235<br>A36               | Steel<br>S355<br>Grade 50 | Aluminum<br>f <sub>u</sub> ≥ 270 MPa | Steel<br>S235<br>A36    | Steel<br>S355<br>Grade 50 |
| Tightening torque serrated flange nut<br>T <sub>rec</sub> [Nm/lbft] | 8/5.9                              | 8/5.9                     | 5/3.6                                | 5/3.6                   | 5/3.6                     |

Important: The tightening torque  $(T_{\rm rec})$  for the serrated flange nut is dependent on the stud type, the base material type and thickness, and the drill hole type. Exceeding the tightening torque  $(T_{\rm rec})$  leads to damage of the S-BT stud's anchorage with negative impact on the load values and the sealing function.

# X-ST-GR Stainless steel threaded stud for fastening to steel

#### **Product data**

#### **Dimensions**

#### Material specifications

Shank: P558 (CrMnMo alloy)

f<sub>u</sub> ≥ 2000 N/mm<sup>2</sup>

Threaded sleeve: A4 (AISI 316)

Washers: polyethylene

# Recommended fastening tools

DX 6 F8, DX 5 F8, DX 460 F8, DX 76 PTR

· See fastener program in the next pages.

#### Approvals

ICC ESR-2347

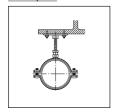

ABS

 Not all information presented in this product data sheet might be subject to approval/certificate content. Please refer to approval/certificate for further information.

### **Applications**

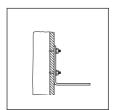

#### Examples

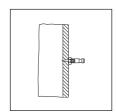

Base plates for pipe rings

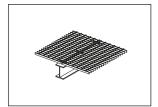

Installation rails

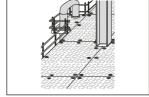

Facade brackets

Special purpose connections

Grating Checker plate

04/2021 www.hitti.group 345

#### Performance data

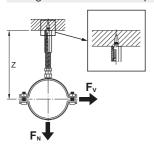

Recommended resistance under tension load, shear load and bending moment

| N <sub>rec</sub> | V <sub>rec</sub> | M <sub>rec</sub> |
|------------------|------------------|------------------|
| 1.8 kN           | 1.8 kN           | 5.5 Nm           |

#### Condition:

• For safety-relevant fastenings sufficient redundancy of the entire system is required.

# Arrangements to reduce or prevent moment on shank

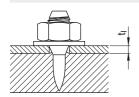

# **Application recommendation**

#### Base material thickness

 $t_{II} \ge 6 \text{ mm}$ 

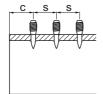

#### Fastened material thickness

 $t_l \le L_g - t_{washer} - t_{nut}$   $t_l \le 10$ mm for X-ST-GR M8/10 P8  $t_l \le 5$ mm for X-ST-GR M8/5 P8

### Fastener positioning in base material

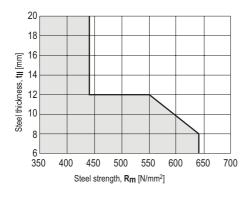

Edge distance:  $c \ge 15 \text{ mm}$ Spacing:  $s \ge 15 \text{ mm}$ 

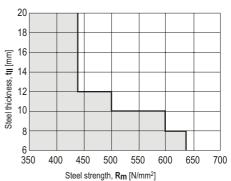

# Application limit

# Tool type: DX 6 F8, DX 5 F8, DX 460 F8

### Tool type: DX 76 PTR

#### Corrosion information

- For fastenings exposed to outdoor environments in mildly corrosive conditions where HDG coated parts are commonly specified or used.
- Not for use in atmospheres with chlorides (marine atmospheres) or in heavily polluted environments (e.g. sulphur dioxide).
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

# System recommendation

 For more details, please refer to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

# Cartridge recommendation

|              | zone               | zone               |                  |                  |
| X-CR M842 P8 | 3.0 kN             | 0.9 kN             | 3.0 kN           | 5.5 Nm           |

- DX-Kwik method (pre-drilling) for fastening to concrete: fcc ≥ 20 N/mm<sup>2</sup>.
- A sufficient redundancy has to be ensured, that the failure of a single fastening will not lead to collapse of the entire system.
- Observance of all pre-drilling requirements.
- For more details in relation to base material properties, please refer to the chapter Fastener selection guide in the Direct Fastening Manual (DFTM).

# **Application recommendation**

#### Base material thickness

X-CR M8-\_\_-42 P8:  $h_{min} = 100 \text{ mm}$ 

# Fastener positioning in base material for fastening to concrete

# Reinforced \* Non-reinforced c 80 mm 150 mm a 80 mm 100 mm

# Application limits for fastening to concrete

No general restrictions existent. Limitations are dependent on application and user requirements.

 $<sup>^*</sup>$  Minimum  $^{\emptyset}$  6 reinforcing steel continuous along all edges and around all corners. Edge bars must be enclosed by stirrups

#### **Corrosion information**

- For fastenings exposed to weather or other corrosive conditions.
- Not for use in highly corrosive surroundings like swimming pools or highway tunnels.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

## System recommendation

• For more details, please refer to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

# Material specifications

① Shank and thread: S31803 (1.4462) at least

equivalent to A4 / AISI grade 316 material

② SN washer: S 31635 (X2CrNiMo 17-12-2,

1.4404)

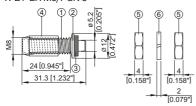

3 Sealing washer: Elastomer, black, resistant to

UV, salt water, water, ozone, oils. etc.

(4) Guided sleeve: Plastic

(§) Nut: A4 / AISI grade 316 material (§) Lock washer: A4 / AISI grade 316 material

#### X-BT-ER M8/7 SN 8

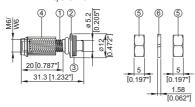

# Recommended fastening tools

BX 3-BT, DX 351-BT

 For more details, please refer to X-BT-ER fastener program and to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

#### X-BT-ER M6/3 SN 8 X-BT-ER W6/3 SN 8

Approvals for X-BT-ER stainless steel threaded studs for electrical connections ABS 18-HS1755518, DNV-GL TAS00001 SV,

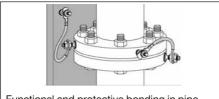

BV 54554, LR 19/0003, UL-file E257067

 Not all information presented in this product data sheet might be subject to approval/certificate content. Please refer to approval/certificate for further information.

### **Applications**

#### Examples

Functional and protective bonding in pipe (Outer diameter of installed surface ≥150 mm)

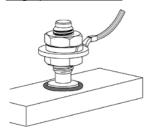

#### Performance data

Functional bonding and terminal connection in a circuit

For low permanent current due to static charge built up in pipes or for low permanent current when closing an electrical circuit

#### Single point connection

Recommended electrical connectors:

X-BT-ER M10/7 SN 8 X-BT-ER W10/7 SN 8

X-BT-ER M8/7 SN 8

X-BT-ER M6/3 SN 8, X-BT-ER M6/7 SN 8 X-BT-ER W6/3 SN 8, X-BT-ER W6/7 SN 8

#### Note:

 Recommended connected cable size (tested to 40 A) according to IEC/ EN 60204-1: ≤ 10 mm² copper (≤ 8 AWG). <u>Fastening of thicker cable</u> is acceptable provided the maximum permanent current of 40 A is not exceeded and the provisions on cable lug thickness are observed.

Maximum allowable

permanent current = 40 A

Max, short circuit current for

period of 1 s = 1250 A

# Protective bonding circuit

For discharging short circuit current while protecting electrical equipment or earth / ground or bonded cable trays and ladders

#### Single point connection

Recommended electrical connectors:

X-BT-ER M10/7 SN 8 X-BT-ER W10/7 SN 8

X-BT-ER M8/7 SN 8

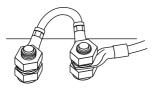

X-BT-ER M6/3 SN 8, X-BT-ER M6/7 SN 8 X-BT-ER W6/3 SN 8, X-BT-ER W6/7 SN 8

#### Note:

- Recommended connected cable size (tested to 1250 A for 1 s) following IEC/EN 60947-7-2: ≤ 10 mm² copper (≤ 8 AWG).
   Fastening of thicker cable is acceptable provided the maximum current of 1250 A for a period of 1 second is not exceeded and the provisions on cable lug thickness are observed.
- Recommended connected cable size (tested to 750 A for 4 s) according to UL 467: ≤ 10 AWG

#### Double point connection

Recommended electrical connectors:

X-BT-ER M10/7 SN 8 X-BT-ER W10/7 SN 8 X-BT-ER M8/7 SN 8 X-BT-ER M6/7 SN 8 X-BT-ER W6/7 SN 8 Max. short circuit current for period of 1 s = 1800 A

#### Note:

Recommended connected cable size (tested to 1800 A for 1 s) following IEC/EN 60947-7-2: ≤ 16 mm² copper (≤ 6 AWG).
 Fastening of thicker cable is acceptable provided the maximum current of 1800 A for a period of 1 second is not exceeded and the provisions on cable lug thickness are observed.

#### Lightning protection

For high temporary current due to lightning.

#### Single point connection

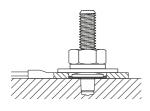

Recommended electrical connectors:

X-BT-ER M10/7 SN 8 X-BT-ER W10/7 SN 8 X-BT-ER M8/7 SN 8

X-BT-ER M6/3 SN 8, X-BT-ER M6/7 SN 8 X-BT-ER W6/3 SN 8, X-BT-ER W6/7 SN 8

- When one nut is utilized and cable lug is in contact with base material.
- Cable lug must be in direct contact with non-coated base material.
- Extra M10/W10 stainless steel washer to be used and installed between lock washer and cable lug.
- Base material must not contact the X-BT-ER SN washer, lock washer and nut.
- Cable lug thickness = 2 mm to 12 mm. Cable lug hole diameter ≥ 14 mm.
- Max. tightening torque = 20 Nm.

Recommended electrical connectors:

X-BT-ER M10/7 SN 8 X-BT-ER W10/7 SN 8 X-BT-ER M8/7 SN 8

X-BT-ER M6/3 SN 8, X-BT-ER M6/7 SN 8 X-BT-ER W6/3 SN 8, X-BT-ER W6/7 SN 8

Maximum test current: ≤ 100 kA for 2 ms

Maximum test current

 $\leq$  50 kA for 2 ms

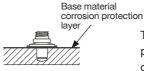

(according to EN 62561-1):

# **Application recommendation**

### Thickness of base material

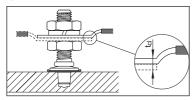

Thickness of base material corrosion protection layer ≤ 0.4 mm. For thicker coatings, please contact Hilti.

#### Thickness of cable lug

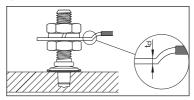

X-BT-ER M8/M10/W10 X-BT-ER M6/W6 /7 SN 8

 $t_{cl} \le 7 \text{ mm } (0.28")$ 

# X-BT-ER M6/W6 /3 SN 8

 $t_{cl} \le 3 \text{ mm } (0.12")$ 

# Spacing and edge distances

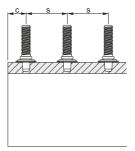

### Edge distance:

c ≥ 6 mm

# Spacing:

s ≥ 15 mm

# Application limit

- t<sub>II</sub> ≥ 8 mm [5/16"] no through penetration
- t<sub>II</sub> ≥ 6 mm for through penetration
- No limits with regards to steel strength

### **Corrosion information**

The corrosion resistance of Hilti CR500 and S31803 stainless steel material is equivalent to AISI 316 (A4) steel grade.

S-BT-ER M10 HC120 S-BT-ER W10 HC AWG4/0 S-BT-EF M10 HC120 S-BT-EF W10 HC AWG4/0

### Material specifications

① Threaded shank: Stainless steel (S-BT-ER)

"S 31803 (1.4462)" zinc-coated

2 Threaded shank: Carbon steel (S-BT-EF) "1038/duplex-coated"

SN12-R washers: Ø 12 mm [0.47"]
Stainless steel (S-BT-ER)

"S 31603 (1.4404)"

4 AN10-F washers: Ø 10 mm [0.39"] Aluminum (S-BT-EF)

Nut: Stainless steel (S-BT-ER) grade A4/AISI 316 material
 Nut: Carbon steel (S-BT-EF)

HDG

Lock washer: Stainless steel (S-BT-ER)
 grade A4/AISI 316 material

B Lock washer: Carbon steel (S-BT-EF)
 HDG

Conductivity disc: Ø 32 mm [1.260"]

Copper alloy CuSn8 (tin-coated) with sealing ring

Sealing ring:

Sealing washers:

Chloroprene rubber CR3.1107, black, resistant to UV, salt water, water,

ozone, oils etc.

Conductivity discs: FKM, Resistant to UV, salt water, water, ozone.

oils, etc.

#### Recommended fastening tool

Refer to section "Fastener selection and system recommendation" for more details.

# Listings and type approvals

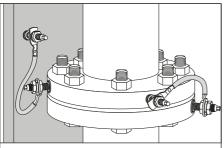

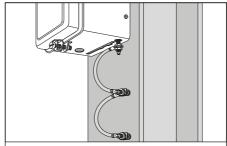

# **Applications**

#### Examples

Functional and protective bonding of pipes \*) (outer diameter of installed surface ≥ 150 mm) \*) only for Type A cable connections

Protective bonding circuit - Double point connection

### Functional bonding and terminal connection in a circuit

For permanent current (leakage current) due to static charge built up in pipes or when closing an electrical circuit.

# Single point connection

| Туре А        | A |  |
|---------------|---|--|
|               |   |  |
| $\overline{}$ |   |  |

Recommended electrical connectors:

S-BT-ER M10/15 SN 6 S-BT-ER W10/15 SN 6 S-BT-EF M10/15 AN 6 S-BT-EF W10/15 AN 6 S-BT-ER M8/15 SN 6 S-BT-EF M8/15 AN 6

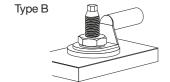

Maximum allowable permanent current

S-BT-ER M10 HC 120 S-BT-ER W10 HC AWG4/0 S-BT-EF M10 HC 120

S-BT-EF W10 HC AWG4/0

 $I_{H} = 269 A$ 

#### Note:

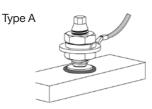

- Recommended maximal cross section of connected cable according IEC 60947-7-2 and IEC 60947-7-1: 10 mm<sup>2</sup> (8 AWG) copper (tested permanent current I<sub>th</sub> = 57 A) 120 mm<sup>2</sup> (4/0 AWG) copper (tested permanent current I<sub>th</sub> = 269 A)
- Fastening of thicker cable is acceptable, if the maximum allowable permanent current I<sub>th</sub> is not exceeded and the provisions on cable lug thickness t<sub>d</sub> are observed.

#### Protective bonding circuit

For discharging short circuit current while protecting electrical equipment or earth/ground cable trays and ladders.

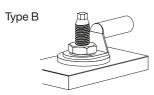

## Single point connection

Recommended electrical connectors:

S-BT-ER M10/15 SN 6 S-BT-ER W10/15 SN 6 S-BT-EF M10/15 AN 6 S-BT-EF W10/15 AN 6 S-BT-ER M8/15 SN 6 S-BT-EF M8/15 AN 6 Max. short circuit current according to IEC and UL

 $I_{cw} = 1.20 \text{ kA (IEC)}$  $I_{cw} = 0.75 \text{ kA (UL)}$ 

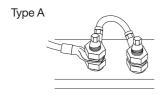

S-BT-ER M10 HC 120 S-BT-ER W10 HC AWG4/0 S-BT-EF M10 HC 120 S-BT-EF W10 HC AWG4/0

 $I_{cw} = 14.40 \text{ kA (IEC)}$  $I_{cw} = 10.10 \text{ kA (UL)}$ 

#### Note:

- Recommended maximal cross section of connected cable according IEC 60947-7-2 and IEC 60947-7-1:
  - 10 mm² (8 AWG) copper (tested short circuit current  $I_{cw}$  = 1.20 kA for 1 s)
- 120 mm<sup>2</sup> (4/0 AWG) copper (tested short circuit current  $I_{cw}$  = 14.40 kA for 1 s) according UL 467:
- 10 AWG copper (tested short circuit current  $I_{cw} = 0.75$  kA for 4 s) 4/0 AWG copper (tested short circuit current  $I_{cw} = 10.10$  kA for 9 s)
- Fastening of thicker cable is acceptable, if the maximum short circuit current I<sub>cw</sub> and the
  exposure time is not exceeded and the provisions on cable lug thickness t<sub>cl</sub> are observed.

## Double point connection

Recommended electrical connectors: S-BT-ER M10/15 SN 6 S-BT-ER W10/15 SN 6 S-BT-EF M10/15 AN 6 S-BT-EF W10/15 AN 6 S-BT-ER M8/15 SN 6

S-BT-EF M8/15 AN 6

Max. short circuit current according to IEC

 $I_{cw} = 1.92 \text{ kA (IEC)}$ 

#### Note:

- Recommended maximal cross section of connected cable according IEC 60947-7-2 and IEC 60947-7-1:
   16 mm² (6 AWG) copper (tested short circuit current I<sub>cur</sub> = 1.92 kA for 1 s)
- Fastening of thicker cable is acceptable, if the maximum short circuit current I<sub>cw</sub> and the exposure time is not exceeded and the provisions on cable lug thickness t<sub>cl</sub> are observed.

## **Lightning protection**

For high temporary current due to lightning.

| Cina | la naint  | aannaatian |
|------|-----------|------------|
| OHIU | ie boilit | connection |

Classification N (acc. IEC 62561-1)

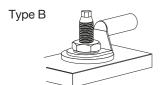

Recommended electrical connectors:

Maximum lightning current

Type A

S-BT-ER M10/15 SN 6 S-BT-ER W10/15 SN 6 S-BT-EF M10/15 AN 6 S-BT-EF W10/15 AN 6 S-BT-ER M8/15 SN 6 S-BT-EF M8/15 AN 6

 $I_{imp} = 50 \text{ kA for } \le 5 \text{ ms}$ (according to IEC 62561-1)

S-BT-ER M10 HC 120 S-BT-ER W10 HC AWG4/0 S-BT-EF M10 HC 120 S-BT-EF W10 HC AWG4/0

Classification H (acc. IEC 62561-1)

Type B

Recommended electrical connectors:

S-BT-ER M10 HC 120 S-BT-ER W10 HC AWG4/0 S-BT-EF M10 HC 120 S-BT-EF W10 HC AWG4/0

 $I_{imp} = 100 \text{ kA for } \le 5 \text{ ms}$ (according to IEC 62561-1)

#### Note:

- When S-BT-ER/-EF is used in class H applications only type B cable connection is allowed.
- Tightening torque of 8 Nm must be observed accurately for type B cable connection.

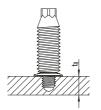

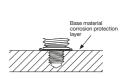

## **Application Requirements**

## Base material thickness t<sub>11</sub> ≥ 6 mm \*)

Thickness of base material corrosion protection layer ≤ 0.8 mm [0.0315"].

For single point connection type B conductivity disc must be in direct contact with non-coated base material.

\*) for the applications "Functional bonding and terminal connection in a circuit" and "Protective bonding circuit" the minimum base material thicknees can be reduced to  $t_{\parallel}$  = 3 mm. Applicable only for Type A, single point connections.

In case of a drill through hole or a pilot hole in thin base material, rework of the coating on the back side of the plate/profile may be needed.

## Cable lug characteristics and connector types

Cable lug thickness t<sub>cl</sub> and inner hole diameter d<sub>2</sub>

## Spacing & edge distances

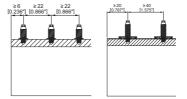

Edge distance:

Type A connector: ≥ 6 mm [0.236"]
Type B connector: ≥ 20 mm [0.787"]

## Spacing:

Type A connector: ≥ 22 mm [0.866"] Type B connector: ≥ 40 mm [1.575"]

## Installation temperature and service temperature

The installation temperature is the temperature at which the S-BT-ER/-EF studs are installed. A distinction is made between the temperature of the base material and the temperature of the S-BT-ER/-EF studs, drilling and installation tools and accessories. The installation temperature range can be found in the table below.

The service temperature is the temperature at which the S-BT-ER/-EF studs operate. The S-BT studs will operate effectively and without any loss in performance (loads, sealing function, etc.) within the specified service temperature range. Outside this temperature range the S-BT-ER/-EF studs may fail.

| Designation                                   | Installation temperature |        | Service temperature |         |
|---|--------------------------|--------|---------------------|---------|
| Designation                                   | min                      | max    | min                 | max     |
| Base material                                 | -40 °C                   | +60 °C | -40 °C              | +100 °C |
| S-BT-ER/-EF studs                             | −10 °C                   | +60 °C | -40 °C              | +100 °C |
| Drilling & Installation tools and accessories | −10 °C                   | +60 °C | n.a.                | n.a.    |

#### Note:

The service temperature range of the connected cable lugs and cables has to be observed. For details please contact the supplier of the cable lugs and cables.

#### **Corrosion information**

The S-BT-ER stainless steel fasteners are made from the duplex stainless steel type 1.4462, which is equivalent to AISI 316 (A4) steel grade. This grade of stainless steel is classified in the corrosion resistance class IV according to DIN EN 1993-1-4:2015, which makes the material suitable for aggressive environments like in coastal and offshore applications. The microstructures of duplex stainless steels consist of a mixture of austenite and ferrite phases. Compared to the austenitic stainless steel grades, duplex stainless steels are magnetic. The surface of the S-BT-ER stainless steel fasteners is zinc-coated (anti-friction coating) in order to reduce the thread forming torque when the stud is screwed in into the base material.

The coating of the carbon steel S-BT-EF fasteners consists of an electroplated Zn-alloy for cathodic protection and a top coat for chemical resistance (Duplex-coating). The thickness of the coating is 35  $\mu$ m. This product is designed for use in corrosive categories C1, C2 and C3 according the standard EN ISO 9223.

The conductivity disc of the S-BT-ER/-EF HC is made from copper alloy CuSn8 with a tin-coating on the surface and a sealing ring on the bottom side. The copper alloy is classified as largely insensitive to stress corrosion cracking and pitting corrosion.

The conductivity disc is designed for use in corrosion categories C1 – C5 according to EN ISO 9223. It is therefore suitable for use in aggressive environments like coastal and offshore applications.

To prevent corrosion of the base material due to the drilling process the following base material thickness tll has to be given.

|  | Fastener                |                            |
|--|-------------------------|----------------------------|

<sup>1)</sup> Real base material thickness, not nominal material thickness or material thickness with coating.

## **Application limit**

The base material is limited to steel grade with a maximum tensile strength  $f_u$  = 630 MPa [91 ksi]. The minimum tensile strength of steel is  $f_u \ge 340$  MPa [49 ksi].

Minimum thickness of base material t<sub>ii</sub>: refer to section "Application Requirements".

Maximum thickness of base material t<sub>11</sub>: no limits.

<sup>&</sup>lt;sup>2)</sup> Damage of the coating on the back side of the plate/profile require a rework of the coating.

<sup>&</sup>lt;sup>3)</sup> Damage of the coating on the back side of the plate/profile require a rework of the coating, if the drilling tools SFBT22-A or SFBT18-A were used for drilling the bore hole. If the tool SBT4-A22 was used for drilling the bore hole, no damage of the coating on the back side of the plate/profile will occur.

#### Fastener quality assurance

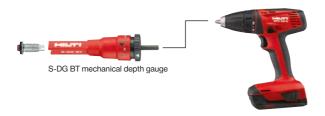

In order to ensure the exact screw-in depth and a proper compressed sealing washer, the S-BT-ER/-EF studs have to be installed with the appropriate depth gauge. With this tool the screw-in depth can be adjusted in a range of 0-1.5 mm (3 steps, 0.5mm per step).

The S-CC BT calibration card is needed to check the initial stand-off of the S-BT-ER/-EF stud and to adjust/calibrate the S-DG BT depth gauge. After finding the right adjustment level for the S-DG BT depth gauge, the gauge can be adjusted and the studs can be installed without additional check of the S-DG BT depth gauge.

The depth gauge has to be re-adjusted (calibrated) at following times:

- Start of the installation process
- Change of the working position (upwards, downwards, horizontal) and base material (thickness, strength, type)
- Installer change
- After each packaging respectively after the installation of 100 S-BT-ER / -EF studs

The lifetime of the S-DG BT depth gauge is ≥ 1000 settings.

Design and functionality of the mechanical calibration card S-CC BT

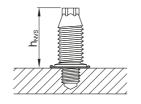

## **Fastening inspection**

The installer is responsible for the correct setting of the S-BT-ER / -EF studs. For the periodical verification of the correct stud stand-off the S-CG BT check gauge can be used.

Verify stud stand-off  $h_{NVS}$  with check gauge S-CG BT

 $h_{NVS}$  = 29.3 mm to 29.8 mm [1.153" to 1.173"]

#### Installation

#### Single point connection

## Single point connection type A:

## Single point connection type B:

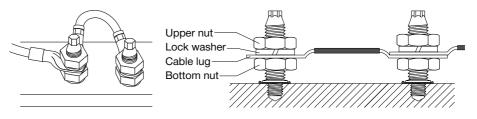

For Type B cable connection the following requirements have to be observed:

- The conductivity disc must be in direct contact with the non-coated base material. Coating has to be removed with the coating removal drill bit.
- Tightening torque of 8 Nm must be observed accurately.

#### Double point connection

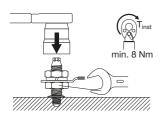

#### Double point connection type A:

#### Torque recommendation for all S-BT-ER and S-BT-EF

## Single point connection type A and double point connection type A:

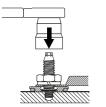

Hold the bottom nut with a spanner while tightening the upper nut.

Tightening Torque: Min. 8 Nm

Max. 20 Nm

## Single point connection type B:

The tightening torque is 8 Nm. Exceeding or falling below this tightening torque value is not allowed. Tighten the nut using torque tool X-BT ¼" (8 Nm), torque wrench or Hilti screw driver SBT 4-A22, SFC 18-A, SFC 22-A (torque setting 5) with socket S-NS.

#### Important:

These are abbreviated instructions which may vary by application.

ALWAYS review/follow the instructions for use (IFU) accompanying the product.

## S-BT-ER (HC)/S-BT-EF (HC)

## Fastener program

## Product description

Adapter M8-MR 25 Adapter M8-MR 50 Adapter M8-MR 75 Adapter M8-MR 100 Adapter M8-MF 25 Adapter M8-MF 50 Adapter M8-MF 75 Adapter M8-MF 100

Adapter M10-MR 50 Adapter M10-MF 50 Adapter W10-MR 50 Adapter W10-MF 50

- For fastenings on steel with passive fire protection (PFP) coating, bare steel members or insulated steel members
- Faster and more efficient no welding/bracketing needed
- Helps to prevent contact between fixtures and steel beams or plates – both uncoated or PFP coated beams
- Versatile threaded standoff adapters can be used as a spacer for a wide range of fastenings on PFP coated beams
- Wide M8 flange nut available for use with Hilti MQ strut channel

■ = Suitable for corrosion prevention

☐ = Suitable, requires expert evaluation

Further information can be found in following Hilti brochures:

- X-BT Threaded Fastener Specification
- New Generation X-BT-GR, X-BT-MR and X-BT-ER Threaded Fastener Specification
- S-BT Threaded Fastener Specification

#### Base materials

Steel

## Load condition

Static/quasi static

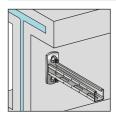

## Approvals and certificates

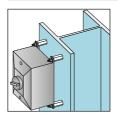

- Information presented in this product data sheet is based on Hilti Technical Data.
- Approvals / certificates available for following fastening systems:
   S-BT threaded studs, X-BT threaded studs

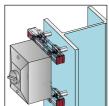

## **Applications**

Fastening on steel with passive fire protection (PFP) coating

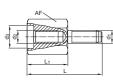

Fastening on bare steel members or insulated steel members

## Performance data

Recommended interaction formula for combined loading

S-BT threaded studs with standoff adapter

V-N (shear and tension) 
$$\frac{V}{V_{rec}} + \frac{N}{N_{rec}} \le 1.0$$
 with  $\frac{V}{V_{rec}} \le 1.0$  and  $\frac{N}{N_{rec}} \le 1.0$ 

X-BT threaded studs with standoff adapter

V-N (shear and tension) 
$$\frac{V}{V_{rec}}$$
 +  $\frac{N}{N_{rec}}$  ≤ 1.2 with  $\frac{V}{V_{rec}}$  ≤ 1.0 and  $\frac{N}{N_{rec}}$  ≤ 1.0

N<sub>rec</sub> = Recommended resistance under tension

V<sub>rec</sub> = Recommended resistance under shear load

N<sub>Rd</sub> = Design resistance under tension load

V<sub>Rd</sub> = Design resistance under shear load

## Conditions for recommended loads and design loads:

- The design resistance can be used for the design according the partial safety concept, e.g. EN 1993-1-1 (Eurocode 3).
- Global factor of safety Ω resp. partial factor of safety γm (based on 5% fractile ultimate test value)
   Recommended loads Design loads

|                 |      | 200.90 |
|-----------------|------|--------|
| static pull-out | 2.80 | 2.00   |
| static shear    | 2.80 | 2.00   |

For the shear resistance values a stand-off distance
Z1 = 30 mm [1.18"], 55 mm [2.16"],
80 mm [3.15"], 105 mm [4.13"] is considered.

- Redundancy (multiple fastening) must be provided.
- Maximum displacement in direction of the shear force ≤ 2.0 mm [0.08"]

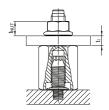

## **Application recommendation**

#### Base material

All requirements for the base material (type, strength, thickness, spacing and edge distances, application limits, etc.) are given in the Product Data Sheet (PDS) of the S-BT fastener and X-BT fastener.

Thickness of fastened material t<sub>1</sub>

Adapter M8-MR and M8-MF: ≤ 9 mm [0.35"] Adapter M10-MR and M10-MF: ≤ 7 mm [0.27"] Adapter W10-MR and W10-MF: ≤ 7 mm [0.27"]

#### Installation recommendation

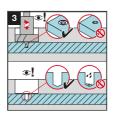

## Fastening standoff adapter with S-BT or X-BT on PFP-coated steel

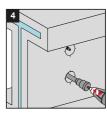

Mark location of each fastening.

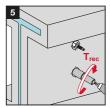

Remove PFP and pre-drill with stepped drill bit ...

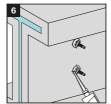

... until shoulder grinds a shiny ring. The drilled hole and the area around drilled hole must be clean and free from liquids and debris.

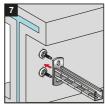

Set studs into drilled hole.

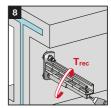

Screw-on the Hilti standoff adapter on the stud and tighten it with the recommended installation torque  $T_{\text{rec}}$  of 8 Nm.

Close the opening within 4 hours of the opening is being made in accordance to the patching instructions by the PEP-manufacturer.

Position accessory on standoff adapter and hold in place. Use of MQZ bore plate as needed for strut applications.

Fasten the accessory on the standoff adapter with the recommended installation torque  $T_{rec}$  of 20 Nm.

## Important notes:

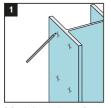

These are abbreviated instructions which may vary by application.

ALWAYS review / follow the instructions for use (IFU) accompanying the product.

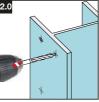

## Fastening standoff adapter with S-BT or X-BT on bare steel members

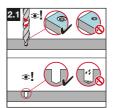

#### Installation instructions

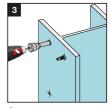

Mark location of each fastening.

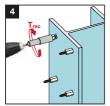

Pre-drill with stepped drill bit ...

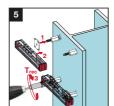

... until shoulder grinds a shiny ring. The drilled hole and the area around drilled hole must be clean and free from liquids and debris.

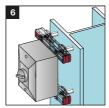

Set studs into drilled hole.

Screw-on the Hilti standoff adapter on the stud and tighten it with the recommended installation torque  $T_{\text{rec}}$  of 8 Nm.

Position channel on standoff adapter and hold in place. Tighten the nuts with a tightening torque T<sub>rec</sub> of 20 Nm.

Fasten the accessory on the channel with the suited installation torque.

## Important notes:

These are abbreviated instructions which may vary by application.

ALWAYS review / follow the instructions for use (IFU) accompanying the product. In case of a drill through hole, rework of the coating on the back side of the plate / profile may be needed

| Tightening torque for standoff adapter |                                     |
|--|-------------------------------------|
|  | Fastener: X-BT-MR, S-BT-MR, S-BT-MF |
| Floments standoff adenter              | 9 Nm                                |

#### Element: standoff adapter | 8 Nm Tightening tool recommendation for tightening with cordless screwdriver Cordless Clutch type Gear Clutch screwdriver (stop detection) SF 4-A22 TRC 1 8 SF 6-A22 ESC (HJ) 1 7 SF 6H-A22 ESC (HJ) 1 7 SBT 4-A22 TRC

Tool power level adjustment:

Gear:

Clutch:

- The setting of the torque via the Hilti screwdriver with torque release coupling (TRC) can change as the clutch wears over time. The specified torque setting is only a rough guide value and applies to a new Hilti screwdriver.
   To ensure recommended torque is applied, Hilti recommends the use of a calibrated torque wrench or the Hilti torque tool.
- The specified torque setting for the Hilti screw drivers with electronic slip clutch (ESC) is only a rough guide value as the ESC has 2 stop detections; Soft Joint (SJ) detection and Hard Joint (HJ) detection. The hard joint detection is activated due to drop in speed (fast stop) and can lead to a torque spike. The installation torque may vary depending on the user and the application. To ensure recommended torque is applied, Hilti recommends the use of a calibrated torque wrench or the Hilti torque tool.

# X-FCM Grating fastening system

## **Product data** Product description Grating element for securing grating Special features X-FCM X-FCM-F X-FCM-R standard disc protrusion above the walkway ≤ 4 mm X-FCM-R I X-FCM-FI large disc protrusion above the walkwav ≤ 8 mm X-FCM-R HL high load resistance · high tension resistance for use in wave zones vibration resistance protrusion above the walkway ≤ 4 mm X-FCM-F NG X-FCM-R NG narrow gratings protrusion above the walkway ≤ 4 mm Special material low corrosion · medium corrosion · high corrosion resistance characteristics resistance resistance · duplex coated · stainless steel · zinc plated

- Discs with locking tabs to ensure durable hold and to prevent loosening or spinning.
- Non-slip disc surface to reduce trip hazard.
- · Cordless solution.
- Labour-saving due to fewer installation steps compared to grating clamps or welding.
- Grating elements will be assembled on pre-installed fasteners.
- Fastener installation is describe in the corresponding Product Data Sheet(s) for fasteners.

#### Notes for next page:

- = expected lifetime of anchors made from this material is typically satisfactory in the specified environment based on the typically expected lifetime of a building. The assumed service life in European Technical Assessments is 50 years for concrete anchors, 25 years for power-driven fasteners, steel and sandwich panel screws, and 10 years for flat roof insulation screws.
- □ = a decrease in the expected lifetime of non-stainless fasteners in these atmospheres must be taken into account (≤ 25 years). Higher expected lifetime needs a specific assessment.
- = fasteners made from this material are not suitable in the specified environment. Exceptions need a specific assessment.
- From a technical point of view, HDG/duplex coatings and A2/304 material are suitable for outdoor environments with certain application restrictions. This is based on long-term experience with these materials as reflected e.g. in the corrosion rates for Zn given in the ISO 9224:2012 (corrosivity categories, C-classes), the selection guidelines for stainless steel grades provided in Eurocode 3 EN 1993 (final draft 2014) or in the national technical approval issued by the DIBT Z.30.3-6 (April 2014) and the ICC-ES evaluation reports for our products for North America (e.g. ESR-1917, May 2013). The use of those materials in outdoor environments however is currently not covered by the European Technical Assessments (ETA) of anchors, where it is stated that anchors made of galvanized carbon steel or stainless steel grade A2 may only be used in structures subject to dry indoor conditions, based on an assumed working life of the anchor of 50 years.

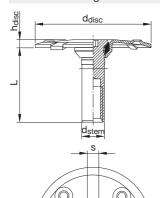

# X-FCM, X-FCM-F, X-FCM-R Securing grating with standard disc

### **Dimensions**

Technical drawings for grating element with standard disc with medium and high corrosion resistance

### Technical drawing

### Designation

X-FCM, X-FCM-F, X-FCM-R

Threaded stem, Disc, Absorber O-Ring.

### Material specification and material properties Material specification and material properties for carbon steel parts Designation Element Material Coating Coating Category of thickness corrosivity of the atmosphere according to EN ISO 9223 Disc, Carbon X-FCM threaded ≥ 20 µm C1 Zinc steel stem Disc. Carbon Duplex X-FCM-F threaded ≥ 30 µm C3 steel coated stem

- Duplex coated steel is comparable to HDG steel.
- Duplex coated steel is tested according to EN ISO 9227: NSS, 480 h on salt spray exposure.

• Data valid for use with stud extension adapter X-SEA.

### Recommended shear load for grating fastening system

- Not suitable for explicit shear load design, e.g. diaphragms.
- Shear resistance by friction is depending on surface characteristics.
- Shear loads up to 0.3 kN will not result in permanent deformation.
- Small unexpected shear loads can be accommodated without damage.

### Design resistance under tension and shear load for grating fastening system

| Load type    | Partial factor for actions | Characteristic resistance         |
|--------------|----------------------------|-----------------------------------|
|              | Υf                         |                                   |
| Tension load | 1.4                        | $N_{Rd} = N_{rec} \cdot \gamma_f$ |
| Shear load   | 1.4                        | $V_{Rd} = V_{rec} \cdot \gamma_f$ |

Design resistance can be calculated.

### Characterstic resistance under tension and shear load for grating fastening system

• For characteristic resistance under shear and tension load contact Hilti.

- Data valid for use with stud extension adapter X-SEA.
- Hilti recommends using a calibrated torque wrench or the Hilti Torque tool to apply the recommended tightening torque.
- Tool power level adjustement is a guiding value which applies to new Hilti screwdriver.
- Tightening torque may vary depending on the user and the application.
- Torque release coupling (TRC): Achievable torque can change over time due to clutch wear.
- Electronic slip clutch (ESC): ESC has 2 stop detections, Soft Joint (SJ) and Hard Joint (HJ). Hard joint detection is activated due to drop in speed (fast stop) and can lead to a torque spike.

### **Material specification** Material specification and material properties for carbon steel parts Designation Element Material Coating Coating Category of thickness corrosivity of the atmosphere according to EN ISO 9223 Disc. Carbon Duplex X-FCM-F L threaded ≥ 30 µm C3 steel coated stem

- Duplex coated steel is comparable to HDG steel.
- Duplex coated steel is tested according to EN ISO 9227: NSS/AASS/CASS, 480 h on salt spray exposure.

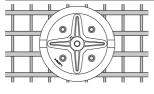

### Material specification and material properties for stainless steel parts Designation Element Material Coating Steel grade Corrosion resistance according class according EN 10088 to EN 1993-1-4 Disc. Stainless X-FCM-R I threaded 1.4404 CRC III steel stem

| Material specification and material properties for plastic parts |          |             |       |                             |  |  |  |

- Hilti recommends using a calibrated torque wrench or the Hilti Torque tool to apply the recommended tightening torque.
- Tool power level adjustement is a guiding value which applies to new Hilti screwdriver.
- Tightening torque may vary depending on the user and the application.
- Torque release coupling (TRC): Achievable torque can change over time due to clutch wear.
- Electronic slip clutch (ESC): ESC has 2 stop detections, Soft Joint (SJ) and Hard Joint (HJ). Hard joint detection is activated due to drop in speed (fast stop) and can lead to a torque spike.

### Application areas

- X-FCM-R HL together with X-BT-GR M8/7 SN 8 threaded fasteners forms a high resistance and robust fastening system to fix grating in marine C5 corrosive environment.
- High tension resistance for use in wave zones.

| Tension load  | 1.4                        | $N_{Rd} = N_{rec} \cdot \gamma_f$ |  |  |  |
| Shear load  | 1.4                        | $V_{Rd} = V_{rec} \cdot \gamma_f$ |  |  |  |

Design resistance can be calculated.

Characterstic resistance under tension and shear load for grating fastening system

 Characteristic tensile loads N<sub>Fik</sub> can be conservatively calculated by multiplying the recommended load values N<sub>me</sub> with the factor 2.8, N<sub>Fik</sub> = 2.8 \* N<sub>me</sub>.

1

ESC (SJ)

- Hilti recommends using a calibrated torque wrench or the Hilti Torque tool to apply the recommended tightening torque.
- Tool power level adjustement is a guiding value which applies to new Hilti screwdriver.
- Tightening torque may vary depending on the user and the application.
- Electronic slip clutch (ESC): ESC has 2 stop detections, Soft Joint (SJ) and Hard Joint (HJ). Hard joint detection is activated due to drop in speed (fast stop) and can lead to a torque spike.

**<sup>(1)</sup>** 

<sup>•</sup> Data valid for use with stud extension adapter X-SEA.

## Recommended shear load for grating fastening system

- Not suitable for explicit shear load design, e.g. diaphragms.
- Shear resistance by friction is depending on surface characteristics.
- Shear loads up to 0.3 kN will not result in permanent deformation.
- Small unexpected shear loads can be accommodated without damage.

#### Design resistance under tension and shear load for grating fastening system

| Load type    | Partial factor for actions | Characteristic resistance         |  |
|--------------|----------------------------|-----------------------------------|--|
|              | $\gamma_{f}$               |                                   |  |
| Tension load | 1.4                        | $N_{Rd} = N_{rec} \cdot \gamma_f$ |  |
| Shear load   | 1.4                        | $V_{Rd} = V_{rec} \cdot \gamma_f$ |  |

• Design resistance can be calculated.

Characterstic resistance under tension and shear load for grating fastening system

• For characteristic resistance under shear and tension load contact Hilti.

- Hilti recommends using a calibrated torque wrench or the Hilti Torque tool to apply the recommended tightening torque.
- Tool power level adjustement is a guiding value which applies to new Hilti screwdriver.
- Tightening torque may vary depending on the user and the application.
- Torque release coupling (TRC): Achievable torque can change over time due to clutch wear.
- Electronic slip clutch (ESC): ESC has 2 stop detections, Soft Joint (SJ) and Hard Joint (HJ). Hard joint detection is activated due to drop in speed (fast stop) and can lead to a torque spike.

# X-FCI-M Grating fastening system

## **Product data**

#### **Dimensions**

X-FCI-M and X-FCI-M L X-FCI-M C

#### Dimension

See main section Fastener selection and system recommendation for dimension W and L.

# Material specifications

See section Material specifications and coatings in the next pages for more details.

# Recommended fastening tools

• For more details, please refer to Fastener selection.

# X-ST-GR M8/10 P8

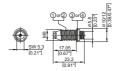

#### X-BT M8-15-6 SN12-R

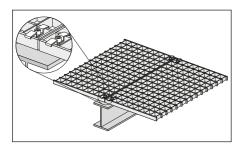

S-BT-GF M8/7 AN 6 S-BT-GR M8/7 SN 6 S-BT-GR M8/7 SN 6 AL

# **Application**

For fastenings exposed to weather and mildly corrosive conditions.

Not for use in marine atmospheres (upstream)!

#### Performance data

Recommended resistance under tension load

 $N_{rec} = 0.8 \text{ kN } (180 \text{ lb})$ 

- Tensile loading is limited by plastic deformation of the saddle clip
- X-FCI-M resists shear by friction and is not suitable for explicit shear load design

# **Application recommendation**

#### Base material thickness

X-BT M8-15-6 X-BT-GR M8/7 S-BT-GF M8/7 AN 6 X-ST-GR S-BT-GR M8/7 SN 6 SN12-R SN8 S-BT-GR M8/7 SN 6 AL\*)  $t_{II} \ge 8 \text{ mm}$ t<sub>II</sub> ≥ 8 mm  $t_{II} \ge 6 \text{ mm}$ steel: 3 mm ≤ t<sub>II</sub> <  $t_{II} \ge 6 \text{ mm}$ 6 mm. aluminum: pilot hole 5 mm ≤ t<sub>II</sub> < 6 mm drill through hole

#### Fastened material thickness

Grating height: X-FCI-M:

HG = 28-52 mm (1.10"–2.05"), other dimensions for X-FCI-M are available on demand.

See Fastener selection for detailed dimensions

#### Fastener positioning in base material

X-ST-GR

Edge distances: c≥15 mm

Spacing:

s ≥ 15 mm

X-BT, X-BT-GR, S-BT

Edge distance: c≥ 6 mm

Spacing: s≥15 mm

<sup>\*)</sup> for use in aluminum base material

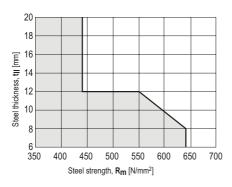

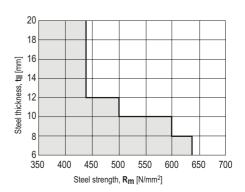

## Application limits

Fastener: X-ST-GR

Tool type: DX 460, DX 5, DX 6

Tool type: DX 76 PTR

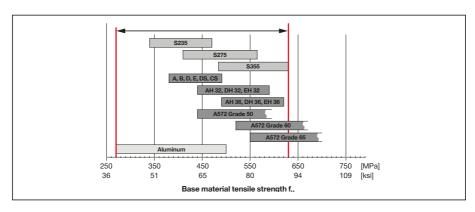

#### Fastener: X-BT and X-BT-GR

No application limits  $\rightarrow$  using in high strength steel (f<sub>u</sub> up to 1000 MPa)

No through penetration  $\rightarrow t_{||} \ge 8 \text{ mm} [^{5}/^{16}]^{1}$ 

## Fastener: S-BT

The base material is limited to steel grade with a maximum tensile strength  $f_u$  = 630 MPa (91 ksi). The minimum tensile strength of steel is  $f_u$  ≥ 340 MPa (49 ksi). The minimum tensile strength of aluminum is  $f_u$  ≥ 270 MPa (39 ksi). Minimum thickness of base material  $t_{II}$ : refer to section "Thickness of base material" Maximum thickness of base material  $t_{II}$ : no limits

#### **Corrosion information**

 For more details, please refer to following technical document: Hilti Corrosion Handbook.

X-FCI-M is used to weather and mildly corrosive conditions, not suitable for coastal and offshore applications.

X-BT, X-BT-GR and S-BT-GR stainless steel fasteners is suitable for coastal and offshore environment. However, they can only be used for weather and mildly corrosive conditions once combining with X-FCI-M.

The coating of the carbon steel S-BT fasteners consists of an electroplated Zn-alloy for cathodic proctection and a top coat for chemical resistance (Duplex-coating). The thickness of the coating is 35  $\mu$ m. The use of this coating is limited to the corrosion category C1, C2 and C3 accoring the standard EN ISO 9223. For higher corrosion categories stainless steel fasteners should be used. In case of a drill through hole, rework of the coating on the back side of the plate/profile may be needed.

The intended use of the X-ST-GR fasteners comprises fastenings exposed to outdoor environments in mildly corrosive conditions where HDG coated parts are commonly specified or used. Not for use in atmospheres with chlorides (marine atmospheres) or in heavily polluted environments (e.g. sulphur dioxide).

## System recommendation

 For more details, please refer to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

Tool power level adjustment:

Gear:

Clutch:

- The setting of the torque via the Hilti screwdriver with torque release coupling (TRC) can change as the clutch wears over time. The specified torque setting is only a rough guide value and applies to a new Hilti screwdriver.
   To ensure recommended torque is applied, Hilti recommends the use of a calibrated torque wrench or the Hilti torque tool.
- The specified torque setting for the Hilti screw drivers with electronic slip clutch (ESC) is only a rough guide value as the ESC has 2 stop detections; Soft Joint (SJ) detection and Hard Joint (HJ) detection. The hard joint detection is activated due to drop in speed (fast stop) and can lead to a torque spike. The installation torque may vary depending on the user and the application. To ensure recommended torque is applied, Hilti recommends the use of a calibrated torque wrench or the Hilti torque tool.

## Material specifications

Screw:

Carbon steel

Zinc coating:

Duplex\* coated

Nail:

Stainless steel:

CrMnMo Alloy and zinc

coated

Upper part:

Carbon steel: Zinc coating:

DD11 or DC01 Duplex\* coated

Bottom part:

Carbon steel: S315MC or DC04 Zinc coating: Duplex\* coated

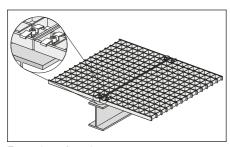

\*) 480 h salt spray test per DIN 50021 and 10 cycles Kesternich test per DIN 50018/2.0 (comparable to 45 µm HDG steel)

Recommended fastening tools DX 6 GR, DX 5 GR and DX 460 GR

· See system recommendation in the next pages.

## **Application**

Fastening of grating

- For fastenings exposed to weather and mildly corrosive conditions.
- Not for use in marine atmospheres (upstream)!

#### Performance data

Recommended resistance under tension load

 $N_{rec} = 0.8 \text{ kN } (180 \text{ lb})$ 

- Tensile loading is limited by plastic deformation of the saddle clip.
- X-GR resists shear by friction and is not suitable for explicit shear load designs.
- For X-GR C: In case of dynamic load  $N_{rec} = 0.6 \text{ kN}$  (135 lb).

## **Application recommendation**

Base material thickness

- **a**
- Tool power level adjustment by setting tests on site.
- Start tool energy selection with lowest recommended tool power level.
- Correct according requirement from chapter quality assurance.

# **Quality assurance**

# Fastening inspection

$$h_{NVS} = 7-10.5 \text{ mm } (0.28"-0.41")$$

 Observing the cartridge selection and tool energy setting typically leads to a stand-off between 9 and 10 mm.

#### Installation recommendation

Tool power level adjustment:

Gear:

Clutch:

- The setting of the torque via the Hilti screwdriver with torque release coupling (TRC) can change as the clutch wears over time. The specified torque setting is only a rough guide value and applies to a new Hilti screwdriver.
   To ensure recommended torque is applied, Hilti recommends the use of a calibrated torque wrench or the Hilti torque tool.
- The specified torque setting for the Hilti screw drivers with electronic slip clutch (ESC) is only a rough guide value as the ESC has 2 stop detections; Soft Joint (SJ) detection and Hard Joint (HJ) detection. The hard joint detection is activated due to drop in speed (fast stop) and can lead to a torque spike. The installation torque may vary depending on the user and the application. To ensure recommended torque is applied, Hilti recommends the use of a calibrated torque wrench or the Hilti torque tool.

# X-FCS-R Grating element

# X-FCS-R Grating element designation

Technology:

X DX solution

Application:

FCS Grating element

Material:

R Stainless steel

Number of saddles:

Three fastening saddles
Four fastening saddles

Bar spacing:

25 Bar spacing

#### **Product data**

#### X-FCS-R-3-25

X-FCS-R-4-25

# Product description

- Grating fastening system is an approved system for securing gratings under tension and shear load
- Grating element is available with three saddles for rectangular gratings and four saddles for square gratings
- Grating element X-FCS-R can be combined with various fasteners

## Grating fastening system

- Information presented in this product data sheet is based on Hilti Technical Data. For the specific application please refer to the corresponding approval/certificate.
- Approvals/certificates available for following grating fastening systems: X-FCS-R-3-25 (Saddles connected to bearing bar: 3) X-FCS-R-4-25 (Saddles connected to bearing bar: 4)

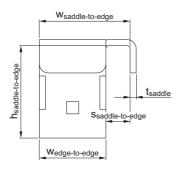

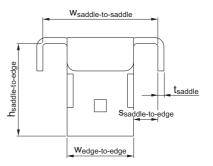

# **Grating element**

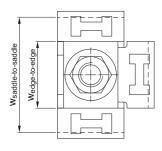

## Grating element definition

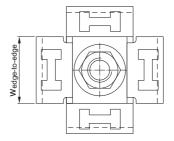

## X-FCS-R-3-25

## X-FCS-R-4-25

 $W_{saddle-to-edge}$  = Width between saddle and edge

w<sub>saddle-to-saddle</sub> = Width between saddles w<sub>edge-to-edge</sub> = Grating element width

 $\boldsymbol{s}_{\text{saddle-to-edge}}~$  = Spacing between saddle and grating edge

 $t_{saddle}$  = Saddle thickness

h<sub>saddle-to-edge</sub> = Grating element height

# Grating element definition

## Design concept for multiple fastening points under tension and shear load

Example: Recommended resistance for rectangular grating under symmetrical load in x-axis

Grating element: X-FCS-R-3-25 Saddles connected to bearing bar: 2 Fastener: X-BT M8-15-6 SN 12 R

Base material: S235

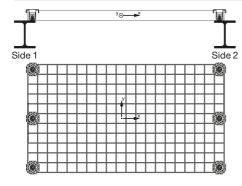

Base material thickness: t<sub>II</sub> = 8 mm

$$N_{\text{rec, GR}} = (n_1 + n_2) \cdot N_{\text{rec}}$$
  
=  $6 \cdot 1.8 = 10.8 \text{ kN}$   
 $V_{\text{rec, GR, y}} = 2 \cdot \min\{n_1; n_2\} \cdot V_{\text{rec, a}}$   
=  $2 \cdot 3 \cdot 2.6 = 15.6 \text{ kN}$   
 $V_{\text{rec, GR, x}} = n_1 \cdot V_{\text{rec, c}}$   
=  $3 \cdot 2.6 = 7.8 \text{ kN}$ 

X-FCS-R-3-25 per side of rectangular grating: Number of X-FCS-R side 1:  $n_1$  = 3 Number of X-FCS-R side 2:  $n_2$  = 3

Note: Load resistance in direction b is neglected due to lower stiffness in direction b compared to direction c.

# Example: Design resistance for square grating under symmetrical load in x-axis

Grating element: X-FCS-R-4-25 Saddles connected to bearing bar: 4 Fastener: S-BT-GR M8/7 SN 6

Base material: S355

Base material thickness: t<sub>II</sub> = 6 mm

$$\begin{array}{ll} N_{\text{Rd, GR}} &= (n_1 + n_2) \cdot N_{\text{Rd}} \\ &= 6 \cdot 3.2 = 19.2 \text{ kN} \\ V_{\text{rec, GR, y}} &= 2 \cdot \min\{n_i; n_2\} \cdot V_{\text{rec, a}} \\ &= 2 \cdot 3 \cdot 4.5 = 27.0 \text{ kN} \\ V_{\text{rec, GR, x}} &= (n_1 + n_2) \cdot V_{\text{rec, c}} \\ &= 6 \cdot 4.5 = 27.0 \text{ kN} \end{array}$$

X-FCS-R-4-25 per side of rectangular grating: Number of X-FCS-R side 1:  $n_1$  = 3 Number of X-FCS-R side 2:  $n_2$  = 3 Note: Load resistance in direction b is neglected due to lower stiffness in direction b compared to direction c.

# **System recommendation**

## System recommendation for tightening grating element

| Grating      | Fastener             | Torque | Tightening tool         | Nut setter  |
|--------------|----------------------|--------|-------------------------|-------------|
| element      |                      | moment |                         |             |
| X-FCS-R-3-25 | X-BT M8-15-6 SN 12-R | 8 Nm   | SBT 4-A22 <sup>1)</sup> | S-NS 12     |
| X-FCS-R-4-25 | X-BT-GR M8/7 SN 8    | 20 Nm  | SFC 22-A <sup>1)</sup>  | C 95/3 3/4" |
|              | S-BT-GR M8/7 SN 6    | 8 Nm   | SFC 22-A"               |             |

<sup>&</sup>lt;sup>1)</sup> Other tightening tools with torque moment control function can be used.

## Fastener setting and installation information

Fastener setting information (e.g. base material properties, fastened material properties and setting energy) and installation information (e.g. quality assurance) are part of the corresponding Product Data Sheet for fasteners.

# **Grating fastening system component**

| Component       | Designation          | Item no. |

# X-PGR-RU Grating fastening system (pre-drilled)

#### **Product data**

# 

Material specifications

Screw: Carbon steel

Zinc coating: Duplex\* coated

Nail:

Stainless steel: CrNiMo Alloy

Upper part:

Carbon steel: DD11

Zinc coating: Duplex\* coated

Bottom part:

Carbon steel: S315MC

Zinc coating: Duplex\* coated

\*) 480 h salt spray test per DIN 50021 and 10 cycles Kesternich test per DIN 50018/2.0 (comparable to 45 μm HDG steel)

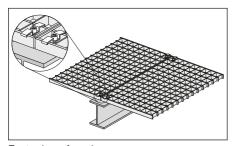

Recommended fastening tools

DX 6 GR, DX 5 GR and DX 460 GR

 See fastener program in the next pages.

#### **Application**

Fastening of grating

For fastenings exposed to weather and mildly corrosive conditions.

Not for use in marine atmospheres (upstream)!

#### Performance data

Recommended resistance under tension load

 $N_{rec} = 0.8 \text{ kN} (180 \text{ lb})$ 

- Tensile loading is limited by plastic deformation of the saddle clip.
- X-PGR-RU resists shear by friction and is not suitable for explicit shear load designs.

#### **Application recommendation**

Base material thickness

 $t_{II} \ge 6 \text{ mm } (0.24")$ 

Fastened material thickness

Grating height: H<sub>G</sub> = 25-40 mm (0.98"-1.57")

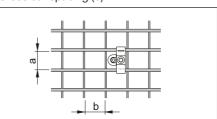

#### Grating opening types

#### Bearing bar spacing (a)

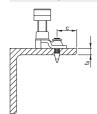

a from 25 to 32 mm (1" to 11/4")

#### Cross bar spacing (b)

 $b \ge 30 \text{ mm} (1.18")$ 

#### Fastener positioning in base material

Edge distance:  $c \ge 15 \text{ mm } (0.59")$ 

# Application limits

#### X-PGR-RU with DX 460 GR, DX 5 GR, DX 6 GR

- pre-drilled
- base material thickness: t<sub>II</sub> ≥ 6 mm [0.24"]
- steel strength: 350 N/mm² ≤ R<sub>m</sub> ≤ 630 N/mm²

#### **Corrosion information**

- For fastenings exposed to weather and mildly corrosive conditions.
- Not for use in marine atmospheres (upstream) or in heavily polluted environments.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

#### System recommendation

 For more details, please refer to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

#### Fastener program

| Fastener       | Item no. | L<br>mm (inch) | Grating height mm (inch) |
|----------------|----------|----------------|--------------------------|
| X-PGR-RU 25/30 | 2061313  | 32 (1.26")     | 25–30 (0.98"–1.18")      |
| X-PGR-RU 11/4" | 2061314  | 34 (1.34")     | 27–32 (1.06"–1.26")      |
| X-PGR-RU 35/40 | 2061315  | 42 (1.65")     | 35–40 (1.38"–1.57")      |

#### Cartridge recommendation

- Tool power level adjustment by setting tests on site.
- Start tool energy selection with lowest recommended tool power level.
- Correct according requirement from chapter quality assurance.

#### **Quality assurance**

#### Pre-drill

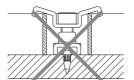

Pre-drill with TX-PGR-RU-4/10-93 step shank drill bit (Item no. 2061802), until shoulder grinds a shiny ring (to ensure proper drilling depth).

# Fastening inspection

 $h_{NVS} = 8-10 \text{ mm} (0.31"-0.39")$ 

The saddle of the fastener should not been bent, see installation instruction above.

These are abbreviated instructions which may vary by application. **ALWAYS** review/follow the instructions accompanying the product.

• Tool power level adjustment:

Clutch:

- The setting of the torque via the Hilti screwdriver with torque release coupling (TRC) can change as the clutch wears over time. The specified torque setting is only a rough guide value and applies to a new Hilti screwdriver.
  - To ensure recommended torque is applied, Hilti recommends the use of a calibrated torque wrench or the Hilti torque tool.
- The specified torque setting for the Hilti screw drivers with electronic slip clutch (ESC) is only a rough guide value as the ESC has 2 stop detections; Soft Joint (SJ) detection and Hard Joint (HJ) detection. The hard joint detection is activated due to drop in speed (fast stop) and can lead to a torque spike. The installation torque may vary depending on the user and the application. To ensure recommended torque is applied, Hilti recommends the use of a calibrated torque wrench or the Hilti torque tool.

## Material specifications

Screw:

Carbon steel

Zinc coating: 60 µm HDG

Upper part:

Carbon steel: SPCC-S

Zinc coating: 65 µm HDG

Bottom part:

Carbon steel: SPCC-S

Zinc coating: 65 µm HDG

Nut:

Carbon steel

Zinc coating: 45 µm HDG

Nut-holder:

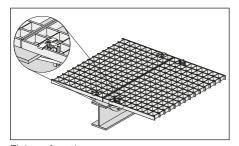

Stainless steel: SS304

Recommended fastening tools SF 121-A, SF150-A, SF 14, SFC 14-A, SF 18-A, SFC 18-A, SF 22-A

 For more details, please refer to X-MGR fastener program and to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

#### **Applications**

For fastenings exposed to weather and mildly corrosive conditions.

Not for use in marine atmospheres (upstream)!

#### Performance data

Recommended tensile loads

 $N_{rec} = 0.6 \text{ kN } (135 \text{ lb})$ 

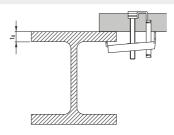

- Tensile loading is limited by plastic deformation of the saddle clip.
- X-MGR resists shear by friction and is not suitable for explicit shear load designs.

#### **Application recommendation**

Thickness of base material

 $t_{II} = 3 - 25 \text{ mm} (0.118 - 0.984'')$ 

#### Thickness of fastened material

Grating height:

 $H_G = 25-40 \text{ mm} (0.98"-1.57")$ 

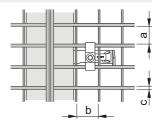

# Total fastening height

 $H_G + t_{||} \le 65 \text{ mm } (2.56")$ 

#### Grating opening types

|           | a          | b            | C              |
|-----------|------------|--------------|----------------|
| Fastener  | mm (inch)  | mm (inch)    | mm (inch)      |
| X-MGR M60 | 30 (1.18") | ≥ 30 (1.18") | ≤ 3 (0.118'')  |
| X-MGR W60 | 25 (0.98") | ≥ 30 (1.18") | ≤ 4.8 (³/¹6'') |

#### Spacing and edge distances

No general restriction exists.

#### **Corrosion information**

For fastenings exposed to weather and mildly corrosive conditions. **Not for use in marine atmosphere (Upstream)** or in heavily polluted environment.

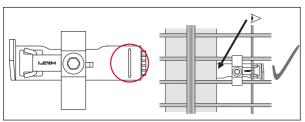

#### Fastener program and system recommendation

#### Approvals

LR: X-FCP ABS, LR: X-FCP-R ABS: X-FCP-F

 Not all information presented in this product data sheet might be subject to approval/certificate content. Please refer to approval/certificate for further information.

#### **Application**

#### Checker plate

#### Application areas for X-FCP system

#### X-FCP-R

- Marine, offshore, petrochemical, caloric (coal, oil) power plants, etc.
- Not for use in automobile tunnels, swimming pools or similar environments.

#### X-FCP-F

- Indoors, mildly corrosive environment, or for limited lifetime use.
- Not for use in marine atmosphere or in heavily polluted environment.

#### Sealing ring

• Drip-through of water/oil needs to be prevented.

#### Performance data

Recommended resistance under tension load

 $N_{rec} = 1.8 [kN]$ 

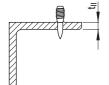

- Limited by the strength of the X-CRM8 and X-ST-GR threaded stud.
- Recommended loads are valid for fastenings of steel and aluminium with 20 mm pre-drilling.
- X-FCP-F and X-FCP-R are not intended for shear loading.

#### **Application recommendation**

Base material thickness

Fastened material thickness

X-CRM8, X-ST-GR

Thickness of checker plates:

 $t_1 \approx 5.0-13.0 \text{ mm}$ 

Steel thickness: t<sub>II</sub> ≥ 6 mm

#### Fastener positioning in base material

#### X-CRM8, X-ST-GR

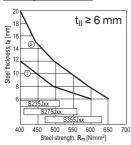

Edge distances:  $c \ge 15 \text{ mm}$ Spacing:  $s \ge 15 \text{ mm}$ 

#### Application limits for X-CRM8

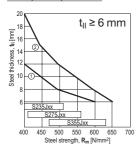

#### DX 76, DX 76 PTR

① Fastener: X-CRM8-\_\_-12 FP10 / Tool type: DX 76 (impact)

② Fastener: X-CRM8-\_\_-12 FP10 / Tool type: DX 76 (co-acting)

#### DX 6, DX 5, DX 460

① Fastener: X-CRM8-\_\_-12 P8 /

Tool type: DX 6, DX 5 (impact), DX 460

② Fastener: X-CRM8-\_\_-12 P8 / Tool type: DX 5 (co-acting), DX 460

 For co-acting operation push the fastener all the way back against the piston with a ramrod.

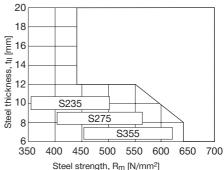

#### Application limits for X-ST-GR

#### Tool type: DX 76 PTR

Tool type: DX 6, DX 5, DX 460

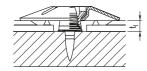

#### **System recommendation**

• For more details, please refer to the chapter **Accessories and consumables compatibility** in the Direct Fastening Technology Manual (DFTM).

# Threaded studs

| Designation      | Fastened material thickness | Tools                                |
|------------------|-----------------------------|--------------------------------------|
|                  | t <sub>I</sub>              |                                      |
| X-CRM8-15-12     | 9–13 mm                     | DX 6, DX 5, DX 460, DX 76, DX 76 PTR |
| X-CRM8-9-12      | 5- 8 mm                     | DX 6, DX 5, DX 460, DX 76, DX 76 PTR |
| X-ST-GR M8/10 P8 | 9–13 mm                     | DX 6, DX 5, DX 460, DX 76 PTR        |
| X-ST-GR M8/5 P8  | 5- 8 mm                     | DX 6, DX 5, DX 460, DX 76 PTR        |

#### Cartridge selection and tool energy setting

- Fastener setting information (e.g. cartridge recommendation, tool power level adjustment, base material properties and fastend material properties) and installation information (e.g. quality assurance) are part of the corresponding product data sheet for fastener.
- Tool power level adjustment by setting tests on site.
- Start tool energy selection with lowest recommended tool power level.
- Correct according requirement from chapter quality assurance.

#### **Quality assurance**

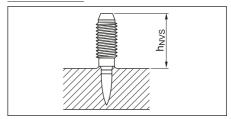

#### Fastening inspection

#### X-CRM8-9-12

 $h_{NVS} = 12.0-15.0 \text{ mm}$ 

# X-CRM8-15-12

 $h_{NVS} = 17.0-20.0 \text{ mm}$ 

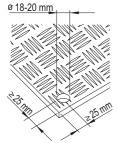

# X-ST-GR

X-ST-GR M8/5 P8,  $h_{NVS}$  = 12.0–15.0 mm X-ST-GR M8/10 P8,  $h_{NVS}$  = 17.0–20.0 mm

#### Pre-drill

Plates must be pre-drilled or pre-punched

#### Installation recommendation

Tightening torque

|                | Fastener: X-ST-GR, X-CRM8 |
|----------------|---------------------------|
| Element: X-FCP | 5–8 Nm                    |

#### Tightening tool recommendation for tightening with cordless screwdriver

| Cordless    | Clutch type      | Gear | Clutch |
|-------------|------------------|------|--------|
| screwdriver | (stop detection) |      |        |
| SF 2-A12    | TRC              | 1    | 15     |
| SF 2H-A12   | TRC              | 1    | 15     |
| SF 4-A22    | TRC              | 1    | 8      |
| SF 6-A22    | ESC (SJ)         | 1    | 7      |
| SF 6H-A22   | ESC (SJ)         | 1    | 7      |

Tool power level adjustment:

Gear

Clutch:

- The setting of the torque via the Hilti screwdriver with torque release coupling (TRC) can change as the clutch wears over time. The specified torque setting is only a rough guide value and applies to a new Hilti screwdriver.
  - To ensure recommended torque is applied, Hilti recommends the use of a calibrated torque wrench or the Hilti torque tool.
- The specified torque setting for the Hilti screw drivers with electronic slip clutch (ESC) is only a rough guide value as the ESC has 2 stop detections; Soft Joint (SJ) detection and Hard Joint (HJ) detection. The hard joint detection is activated due to drop in speed (fast stop) and can lead to a torque spike. The installation torque may vary depending on the user and the application. To ensure recommended torque is applied, Hilti recommends the use of a calibrated torque wrench or the Hilti torque tool.

#### Tightening tool recommendation for tightening with Hilti torque tool

Hilti torque tool

Torque tool S-BT 1/4" - 5 Nm

Torque tool X-BT 1/4" - 8 Nm

#### **Fastener program**

Item no. and description

| Designation | Item no. | Description   |
|-------------|----------|---------------|
| X-FCP-R     | 308860   | Checker plate |
| X-FCP-F     | 308859   | Checker plate |

# X-IE-G 6 and X-IE-G 9 insulation fasteners

#### **Product data**

# X-IE-G 6

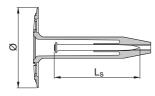

X-IF-G 9

## Product description

- Suitable for a wide range of insulation materials –
   Soft mineral wool, mineral wool, EPS, XPS, PIR, PUR, soft core multilayer board, rigid core multilayer board
- Suitable for 25–200 mm thick insulation
- Very high thermal efficiency in a one-step solution
- No holes in the fastener shank helping prevent mold and moisture penetration in the insulation material
- Gauge included for easy visual control of correct fastener driving depth
- Specially-designed 90 mm disc diameter for soft mineral wool, providing excellent clamping of the insulation

#### **Dimensions**

| Designation | Diameter Ø | Nail length L <sub>s</sub> |  |
|-------------|------------|----------------------------|--|
| X-IE-G 6    | 60 mm      | 36 mm                      |  |
| X-IE-G 9    | 90 mm      | 36 mm                      |  |
|             |            |                            |  |
|             |            |                            |  |
|             |            |                            |  |

#### Material properties for plastic parts

| Element | Designation | Material | Color     | Other properties       |
|---------|-------------|----------|-----------|------------------------|
| Plate   | X-IE-G 6    | HDPE     | Colorless | UV stabilized material |
| Plate   | X-IE-G 9    | HDPE     | Black     | UV stabilized material |

| Material properties for carbon steel parts |             |              |         |                           |          |
|--|-------------|--------------|---------|---------------------------|----------|
| Element                                    | Designation | Material     | Coating | Minimum coating thickness | Hardness |
| Nail                                       | X-P 36 G3   | Carbon steel | Zinc    | 2 µm                      | 57.5 HRC |

# **Applications**

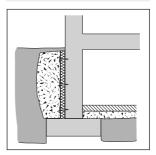

# Curtain wall insulation

#### Ceiling insulation

# Basement perimeter insulation

#### Base materials

Medium concrete

Solid sandlime masonry

Solid brick

#### Fastened materials

Mineral wool

**EPS** 

**XPS** 

PUŔ

Soft and rigid core multilayer board

- Soft core multilayer board: hard top layer with insulation core of mineral wool
- Rigid core multilayer board: hard top layer with insulation core of EPS, XPS, PIR, **PUR**

#### Load condition

Static quasi-static

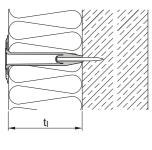

#### Environmental conditions

- The intended use comprises fastening in dry conditions.
- During construction, exposure to UV due to solar radiation of the fixing element not protected by rendering shall not exceed the time of 6 weeks.
- The temperature during installation of the fixing element shall not be less than 5 °C.

#### **Application requirements**

#### Fastened material properties

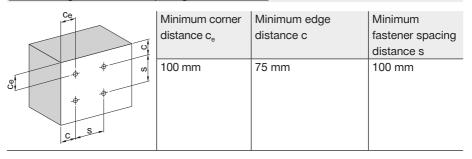

| Fastened                       | Compressive             | Fastened                 |
|--------------------------------|-------------------------|--------------------------|
| material                       | strength                | material                 |
|                                |                         | thickness t <sub>I</sub> |
| Soft mineral wool              | < 500 kN/m <sup>2</sup> | 25-200 mm                |
| Mineral wool                   | < 500 kN/m <sup>2</sup> | 25-200 mm                |
| EPS, XPS, PIR,                 |                         |                          |
| PUR, soft core                 | < 500 kN/m <sup>2</sup> | 25-200 mm                |
| multilayer board               |                         |                          |
| Rigid core<br>multilayer board | < 500 kN/m <sup>2</sup> | 19–197 mm                |

#### Base material properties

|    | Base material           | Base material strength                     | Base material thickness t <sub>II</sub> |
|----|-------------------------|--|---|
|    | Soft, medium concrete   | f <sub>cc</sub> = 15–45 N/mm <sup>2</sup>  | ≥ 80 mm                                 |
| tı | Tough concrete          | f <sub>cc</sub> = 45-65 N/mm <sup>2</sup>  | ≥ 80 mm                                 |
|    | Solid sand-lime masonry | f <sub>b</sub> = 15–45 N/mm <sup>2</sup>   | -                                       |
|    | Solid brick             | f <sub>b</sub> = 28–45 N/mm <sup>2</sup>   | _                                       |
|    | Steel                   | f <sub>u</sub> = 360–450 N/mm <sup>2</sup> | 4–6 mm                                  |

# Fastener edge distance and spacing in base material

# Fastener edge distance and spacing in insulation material

#### Number of fasteners per m<sup>2</sup>

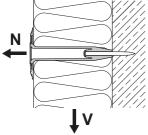

| Fastened material           | Fastened material weight | Minimum number of            |  |
|-----------------------------|--------------------------|------------------------------|--|
|                             |                          | fasteners per m <sup>2</sup> |  |
| Soft mineral wool, mineral  | < 50 kg/m <sup>2</sup>   | 4                            |  |
| wool, EPS, XPS, PIR, PUR,   | 50-75 kg/m <sup>2</sup>  | 5                            |  |
| soft core multilayer board, | > 75 kg/m <sup>2</sup>   | 7                            |  |
| rigid core multilayer board |                          |                              |  |

| Fastened material           | Fastened material density | Minimum number of            |
|-----------------------------|---------------------------|------------------------------|
|                             |                           | fasteners per m <sup>2</sup> |
| Soft mineral wool, mineral  | < 10 kg/m <sup>3</sup>    | 4                            |
| wool, EPS, XPS, PIR, PUR,   | 10-15 kg/m <sup>3</sup>   | 5                            |
| soft core multilayer board, | > 15 kg/m <sup>3</sup>    | 7                            |
| rigid core multilayer board |                           |                              |

#### Performance data

#### Recommended resistance under tension and shear load

| Tension          | Shear            |
|------------------|------------------|
| N <sub>rec</sub> | V <sub>rec</sub> |
| 0.1 kN           | 0.1 kN           |
| 0.1 kN           | 0.1 kN           |
| 0.1 kN           | 0.1 kN           |
|                  |                  |
|                  |                  |
|                  |                  |
|                  | 0.1 kN<br>0.1 kN |

- For more details in relation to base material properties, please refer to the chapter **Fastener selection guide** in the Direct Fastening Technology Manual (DFTM).
- The above data value for solid sand-lime masonry and solid brick are based on laboratory and field experience. Because of the wide variety of types and forms of masonry in use worldwide, users are advised to carry out tests on site or on masonry of the type and form on which the fastenings are to be made.
- The above data refers to the fastener pull-out failure mode.
- For pull-over under tension load please consult insulation material supplier.

#### Stick rate estimation

| Designation | Soft, medium concrete                     |
|-------------|---|
|             | $15 \le f_{c,cube} \le 45 \text{ N/mm}^2$ |
|             | Up to 90%                                 |
|             |   |

The stick rate indicates the percentage of nails that were driven correctly to carry a load. Stick rate can vary from the above values depending on job site conditions

## Thermal efficiency according to EOTA TR 025

| Application             | Insulation thickness | Point thermal transmittance |
|-------------------------|----------------------|-----------------------------|
|                         | t,                   | x                           |
| Curtain wall insulation | 60–90 mm             | 0.002 W/K                   |
| Curtain wall insulation | 100-200 mm           | 0.001 W/K                   |
| Coiling inculation      | 60–90 mm             | 0.002 W/K                   |
| Ceiling insulation      | 100–200 mm           | 0.001 W/K                   |
| Decement perimeter      | 60 mm                | 0.003 W/K                   |
| Basement perimeter      | 70–100 mm            | 0.002 W/K                   |
| insulation              | 120-200 mm           | 0.001 W/K                   |

- Insulation board thickness tolerance: ±3 mm
- Soft mineral wool, mineral wool: for intermediate thicknesses use next shorter fastener, example: for mineral wool insulation thickness 110 mm, use X-IE-G 6-100
- EPS, XPS, PIR, PUR, soft core multilayer board: for intermediate thicknesses use next longer fastener, example: for PIR insulation thickness 110 mm, use X-IE-G 6-120
- Rigid core multilayer board: for thicknesses not specified, please contact Hilti

#### Setting depth control and power tool adjustment

# Check setting depth with the gauge immediately after fastening

- Visible setting failures must be replaced with a new fastener, not in the same hole
- These are abbreviated instructions which may vary by application.
- ALWAYS review/follow the instructions accompanying the product

# X-IE 6 and X-IE 9 insulation fasteners

#### **Product data**

#### X-IE 6

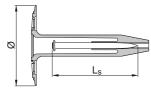

#### X-IF 9

#### Product description

- Suitable for a wide range of insulation materials –
   Soft mineral wool, mineral wool, EPS, XPS, PIR, PUR, soft core multilayer board, rigid core multilayer board
- Suitable for 20-200 mm thick insulation
- Very high thermal efficiency in a one-step solution
- No holes in the fastener shank helping prevent mold and moisture penetration in the insulation material
- Gauge included for easy visual control of correct fastener driving depth
- Specially-designed 90 mm disc diameter for soft mineral wool, providing excellent clamping of the insulation

#### **Dimensions**

| Designation | Diameter Ø | Nail length L <sub>s</sub> |  |
|-------------|------------|----------------------------|--|
| X-IE 6      | 60 mm      | 47-62 mm                   |  |
| X-IE 9      | 90 mm      | 47-62 mm                   |  |
|             |            |                            |  |

#### Material properties for plastic parts

| Element | Designation | Material | Color     | Other properties       |

# **Applications**

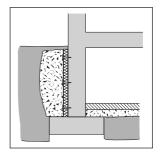

#### Curtain wall insulation

# Ceiling insulation

# Basement perimeter insulation

#### Base materials

Soft concrete

Medium concrete

Tough concrete

Solid sandlime masonry

Solid brick

Steel

#### Fastened materials

Mineral wool

EPS

XPS

PIR, PUR

Soft and rigid core multilayer board

- Soft core multilayer board: hard top layer with insulation core of mineral wool
- Rigid core multilayer board: hard top layer with insulation core of EPS, XPS, PIR, PUR

## Load condition

Static quasi-static

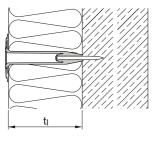

#### **Environmental conditions**

- The intended use comprises fastening in dry conditions.
- During construction, exposure to UV due to solar radiation of the fixing element not protected by rendering shall not exceed the time of 6 weeks.
- $\bullet$  The temperature during installation of the fixing element shall not be less than 5 °C.

## **Application requirements**

#### Fastened material properties

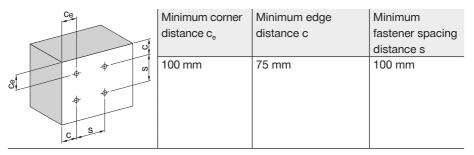

| Fastened                       | Compressive             | Fastened                 |

#### Performance data

#### Recommended resistance under tension and shear load

| Base material           | Tension          | Shear            |
|-------------------------|------------------|------------------|
|                         | N <sub>rec</sub> | V <sub>rec</sub> |
| Soft, medium concrete   | 0.4 kN           | 0.4 kN           |
| Tough concrete          | 0.2 kN           | 0.2 kN           |
| Solid sand-lime masonry | 0.2 kN           | 0.2 kN           |
| Solid brick             | 0.2 kN           | 0.2 kN           |
| Steel                   | 0.6 kN           | 0.6 kN           |
|                         |                  |                  |
|                         |                  |                  |

- For more details in relation to base material properties, please refer to the chapter **Fastener selection guide** in the Direct Fastening Technology Manual (DFTM).
- The above data value for solid sand-lime masonry and solid brick are based on laboratory and field experience. Because of the wide variety of types and forms of masonry in use worldwide, users are advised to carry out tests on site or on masonry of the type and form on which the fastenings are to be made.
- The above data refers to the fastener pull-out failure mode.
- For pull-over under tension load please consult insulation material supplier.

#### Stick rate estimation

| Designation    | Soft, medium concrete                     |   |  |
|----------------|---|---|--|
|                | $15 \le f_{c,cube} \le 45 \text{ N/mm}^2$ | 45 < f <sub>c,cube</sub> ≤ 65 N/mm <sup>2</sup> |  |
| X-IE 6, X-IE 9 | 90%-95%                                   | 85%-90%   |  |
|                |   |   |  |

The stick rate indicates the percentage of nails that were driven correctly to carry a load. Stick rate can vary from the above values depending on job site conditions

#### Thermal efficiency according to EOTA TR 025

| Application             | Insulation thickness | Point thermal transmittance |  |
|-------------------------|----------------------|-----------------------------|--|
|                         | t,                   | x                           |  |
| Curtain wall insulation | 60–90 mm             | 0.002 W/K                   |  |
| Curtain waii insulation | 100-200 mm           | 0.001 W/K                   |  |
| Coiling inquistion      | 60–90 mm             | 0.002 W/K                   |  |
| Ceiling insulation      | 100-200 mm           | 0.001 W/K                   |  |
| Pagament parimeter      | 60 mm                | 0.003 W/K                   |  |
| Basement perimeter      | 70–100 mm            | 0.002 W/K                   |  |
| insulation              | 120-200 mm           | 0.001 W/K                   |  |

#### System recommendation

• For more details, please refer to the chapter **Accessories and consumables compatibility** in the Direct Fastening Technology Manual (DFTM).

- Insulation board thickness tolerance: ±3 mm
- Soft mineral wool, mineral wool: for intermediate thicknesses use next shorter fastener, example: for mineral wool insulation thickness 110 mm, use X-IE 6-100
- EPS, XPS, PIR, PUR, soft core multilayer board: for intermediate thicknesses use next longer fastener, example: for PIR insulation thickness 110 mm, use X-IE 6-120
- Rigid core multilayer board: for thicknesses not specified, please contact Hilti

#### Setting depth control and power tool adjustment

# Check setting depth with the gauge immediately after fastening

#### Adjust the power setting if required

- Visible setting failures must be replaced with a new fastener, not in the same hole
- These are abbreviated instructions which may vary by application.
- ALWAYS review/follow the instructions accompanying the product

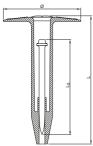

#### XI-FV ETICS Insulation fastener

#### Product data

#### **Dimensions**

XI-FV

HDT-FV 90 HDT-FV 140

#### Material specifications

Plate: XI-FV - HDPE, Orange

HDT-FV - HDPE, Orange

Nail: Carbon steel shank: HRC 58

Zinc coating: Delta-Tone

#### Recommended fastening tools

DX 6 IE, DX 6 IE XL, DX 5 IE, DX 5 IE XL, DX 460 IE, DX 460 IE XL

See fastener program in the next pages.

#### Approvals

ETA-17/0304, DOP no. Hilti-DX-DoP-006

 Not all information presented in this product data sheet might be subject to approval/certificate content. Please refer to approval/certificate for further information.

#### **Applications**

#### External Thermal Insulation Composite System (ETICS)

#### Examples

The XI-FV fastener is used to transfer wind suction loads acting on the thermal insulation composite system.

The base material is normal weight concrete, which is either uncoated or coated with plaster or tiles. Coatings with plaster or tiles is often met if existing buildings are renovated and are improved with regards to their thermal insulation properties.

| Performance data and application recommendation        |                     |        |
|--|---------------------|--------|
| Fixing element   |                     | XI-FV  |
| Characteristic tension resistance in uncoated concrete | N <sub>Rk,p</sub> = | 1.0 kN |
| fastener pull-out                                      | ,                   |        |
| Partial safety factor, fastener pull-out               | γ <sub>M</sub> =    | 2.0    |
| Partial safety factor for variable action              | γ <sub>Q</sub> =    | 1.5    |
| of wind suction forces                                 |                     |        |
| Mean anchorage depth                                   | h <sub>V</sub> =    | 30 mm  |
| Spacing  | S <sub>c</sub> ≥    | 100 mm |
| Edge distance  | c <sub>c</sub> ≥    | 75 mm  |
| Corner distance  | c <sub>e</sub> ≥    | 100 mm |
| Thickness of concrete member                           | h≥                  | 100 mm |

Characteristic resistance in concrete which is coated with plaster or tiles, see ETA-17/0304

Design value of resistance:  $N_{Rd} = N_{Rk,p} / \gamma_{M}$ 

Design value of action:  $N_{Sd} = N_{Sk} \cdot \gamma_{Q}$ 

 $N_{Sd} \le N_{Rd}$ 

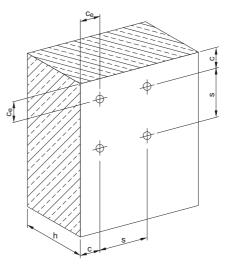

Please refer to ETA-17/0304 for detailed information on:

- the intended use (e.g. thickness of plaster and adhesive layer)
- verification of setting energy by means of control tests
- plate stiffness and point thermal transmittance

In case of concrete coated with plaster and tiles, the characteristic tension pull-out resistance needs in general be verified by job-site tests in accordance with EOTA Technical Report TR52: Recommendations for job-site tests of powder-actuated fasteners for ETICS for use in concrete.

Applicable insulation material are EPS and mineral wool.

# Schematic illustration of spacings of fixing elements

#### Base material

Concrete: C12/15 to C35/45

#### **Corrosion information**

The intended use comprises fastenings of thermal insulation composite systems which are subject to external atmospheric exposure.

During construction, exposure to UV due to solar radiation of the fixing element not protected by rendering shall not exceed the time of 6 weeks.

The temperature during installation of the fixing element shall not be less than 5 °C.

#### System recommendation

 For more details, please refer to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

#### Fastener program

|             |          | 1        |                |
|-------------|----------|----------|----------------|
| Designation | Fastener | Item no. | Insulation     |
|             |          |          | thickness      |
|             |          |          | h <sub>D</sub> |
| XI-FV 60    | X-CPH 72 | 376484   | 60 mm          |
| XI-FV 80    | X-CPH 72 | 376485   | 80 mm          |
| XI-FV 100   | X-CPH 72 | 376489   | 100 mm         |
| XI-FV 120   | X-CPH 72 | 376490   | 120 mm         |
| XI-FV 140   | X-CPH 72 | 376491   | 140 mm         |
| XI-FV 160   | X-CPH 72 | 2069160  | 160 mm         |
| XI-FV 180   | X-CPH 72 | 2069161  | 180 mm         |
| XI-FV 200   | X-CPH 72 | 2069162  | 200 mm         |
| HDT-FV 90   | -        | 285628   | -              |
| HDT-FV 140  | _        | 372907   | _              |

• For soft mineral wool use XI-FV with HDT-FV 90 and HDT-FV 140.

#### Cartridge recommendation

| Base material        | Cartridge color (tool power level) |                          |  |
|----------------------|------------------------------------|--------------------------|--|
| l ool type:          | Tool type:<br>DX 5 IE, DX 5 IE XL, |                          |  |
|                      | Cartridge type: 6.8/11 M           | DX 460 IE, DX 460 IE XL  |  |
|                      |                                    | Cartridge type: 6.8/11 M |  |
| Soft/medium concrete |                                    | yellow □, red ■          |  |
| Tough concrete       | titanium ■ (6-8)                   | yellow □, red ■          |  |

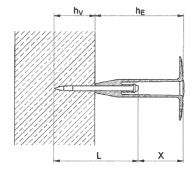

- Tool power level adjustment by setting tests on site.
- Start tool energy selection with lowest recommended tool power level.
- Correct according requirement from chapter quality assurance.

#### **Quality assurance**

#### Cartridge colour and tool energy selection

Example in case of uncoated concrete (Annex B4 of ETA-17/0304: By means of the control tests made to uncoated concrete, the cartridge colour and tool energy required for driving in XI-FV for achieving the mean anchorage depth, hv, is determined. Please refer to XI-FV ETA approval for more details.

$$h_V = (\ell_N + X) - h_E = 30 \text{ mm}$$

where

h<sub>V</sub> = mean anchorage depth

h<sub>E</sub> = length of plastic part

L = length of powder actuated fastener

X = control dimension

| Designation | Insulation thickness | Control dimension |
|-------------|----------------------|-------------------|
|             | t <sub>i</sub>       | X                 |
| XI-FV 60    | 60 mm                | ≥ 12.5 mm         |
| XI-FV 80    | 80 mm                | ≥ 32.5 mm         |
| XI-FV 100   | 100 mm               | ≥ 52.5 mm         |
| XI-FV 120   | 120 mm               | ≥ 72.5 mm         |
| XI-FV 140   | 140 mm               | ≥ 92.5 mm         |
| XI-FV 160   | 160 mm               | ≥ 112.5 mm        |
| XI-FV 180   | 180 mm               | ≥ 132.5 mm        |
| XI-FV 200   | 200 mm               | ≥ 152.5 mm        |

These are abbreviated instructions which may vary by application.

**ALWAYS** review/follow the instructions accompanying the product.

#### X-SW Soft washer

#### X-SW Soft washer

#### **Product data**

#### Product description

X-SW 30 MX X-SW 30-C

X-SW 60 MX X-SW 60-C

• Bearing surface engineered for better clamping of thin

- membranes
- Soft washer conforms to uneven surfaces

membranes

- 30 mm soft washer suitable for fastening fabric waterproofing membranes to concrete surfaces
- 60 mm soft washer provides large bearing surface for superior clamping of thin and delicate membranes

#### Dimensions for plastic elements

# X-SW Soft washer – Fastening drainage membrane to concrete

#### **Application recommendation**

#### Fastened material propertiesl

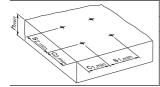

| <b>3</b> 1 |  |                   |
|------------|--|-------------------|
|            | Fastened material  | Drainage membrane |
|            | Fastened material thickness $t_{\scriptscriptstyle \rm I}$ | 2–10 mm           |
|            |  |                   |
|            |  |                   |
|            |  |                   |
|            |  |                   |
|            |  |                   |
|            |  |                   |
|            |  |                   |
|            |  |                   |

#### Fastener positioning in fastened material

• Please consult drainage membrane supplier for data with regard to fastener edge distance, spacing and minimum number of fasteners per m<sup>2</sup>.

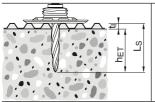

#### Base material properties and fastener positioning in base material

| Base material  | Concrete |
|--|----------|
| Base material thickness h <sub>min</sub>                 | 80 mm    |
| Edge distance c <sub>1,min,</sub> c <sub>2,min</sub>     | 70 mm    |
| Fastener spacing s <sub>1,min</sub> , s <sub>2,min</sub> | 100 mm   |
|  |          |

• For more details in relation to base material properties, please refer to the chapter **Fastener selection guide** in the Direct Fastening Technology Manual (DFTM).

#### Fastener shank length recommendation

For standard fastening:

$$L_s = h_{ET} + t_I$$

#### Performance data

Temporary application, no load data required.

#### Stick rate estimation

| Designation         | Soft/medium | Tough    |
|---------------------|-------------|----------|
|                     | concrete    | concrete |
| X-SW MX + X-X 27 MX | -           | 70-80 %  |
| X-SW MX + X-C MX    | -           | -        |
| X-SW MX + X-GN MX   | -           | -        |

- The stick rate indicates the percentage of nails that were driven correctly to carry a load.
- Stick rate can vary from the above values depending on job site conditions.

#### System recommendation

• For more details, please refer to the chapter **Accessories and consumables compatibility** in the Direct Fastening Technology Manual (DFTM).

#### Recommendation for fastening collated nails with powder-actuated tool

| SVNIE                 | Fastener stand-off h <sub>NVS</sub> | 7–11 mm |

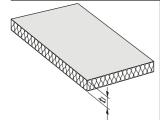

- Visible setting failures must be replaced with a new fastener, not in the same hole.
  - These are abbreviated instructions which may vary by application.
  - Always review/follow the instructions accompanying the product.

#### X-SW Soft washer - Fastening insulation to concrete

#### **Application recommendation**

#### Fastened material properties

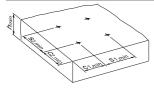

| L | Fastened material  | Insulation |
|---|--|------------|
|   | Fastened material thickness $t_{\scriptscriptstyle \rm I}$ | 2-30 mm    |

 Please consult insulation supplier for data with regard to fastener edge distance, spacing and minimum number of fasteners per m<sup>2</sup>.

#### Base material properties and fastener positioning in base material

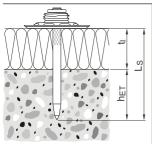

| Base material  | Concrete |
|--|----------|
| Base material thickness h <sub>min</sub>                 | 80 mm    |
| Edge distance c <sub>1,min</sub> , c <sub>2,min</sub>    | 70 mm    |
| Fastener spacing s <sub>1,min</sub> , s <sub>2,min</sub> | 100 mm   |
|  |          |

#### Base material properties

• For more details, please refer to the chapter **Fastener selection guide** in the Direct Fastening Technology Manual (DFTM).

#### Fastener shank length recommendation

For standard fastening:

$$L_s = h_{ET} + t_I$$

#### Performance data

#### Recommended resistance under tension and shear load

| Designation | Tension load N <sub>rec</sub> N <sub>rec</sub> | Shear load V <sub>rec</sub> |
|-------------|--|-----------------------------|
|             | Soft/medium concrete                           | Soft/medium concrete        |
| X-SW + X-C  | 0.30 kN  | 0.30 kN                     |
| X-SW 30-C   | 0.30 kN  | 0.30 kN                     |
| X-SW 60-C   | 0.30 kN  | 0.30 kN                     |

- Redundancy of fastening points is required.
- Minimum number of fastening points for safety relevant fastenings: ≥ 5.
- Predominantly static loading.
- Design loads valid for nail pull-out strength.
- Fastened material has to be considered separately.
- Valid for concrete C 30/37.
- For more details in relation to base material properties, please refer to the chapter Fastener selection guide in the Direct Fastening Manual (DFTM).

#### Stick rate estimation

| Designation | Soft/medium | Tough    |
|-------------|-------------|----------|
|             | concrete    | concrete |
| X-SW + X-C  | -           | _        |
| X-SW 30-C   | _           | _        |
| X-SW 60-C   | _           | -        |

- The stick rate indicates the percentage of nails that were driven correctly to carry a load.
- Stick rate can vary from the above values depending on job site conditions.

#### System recommendation

| - |   |  |

- Tool power level adjustment by setting tests on site.
- Start tool energy selection with lowest recommended tool power level.
- Correct according requirement from chapter quality assurance.

# Quality assurance Setting depth control

- Visible setting failures must be replaced with a new fastener, not in the same hole.
- These are abbreviated instructions which may vary by application.
- Always review/follow the instructions accompanying the product.

#### Form stop fasteners

#### X-FS Form stop

#### X-FS Form stop

#### **Product data**

#### Product description

#### X-FS MX

 Facilitates quick and easy positioning of formwork panels on concrete

X-FS

- Designed for extremely high productivity up to five times faster than traditional methods
- Easy to install even on rough concrete surfaces
- Stronger bond with the concrete due to large openings
- Formwork spacers remain hardly visible or fully hidden in concrete after removing formwork

#### Dimensions for plastic elements

- Tool power level adjustment by setting tests on site.
- Start tool energy selection with lowest recommended tool power level.
- Correct according requirement from chapter quality assurance.

#### **Quality assurance**

#### Setting depth control

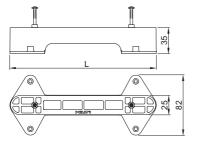

- Visible setting failures must be replaced with a new fastener, not in the same hole.
- These are abbreviated instructions which may vary by application.
- Always review/follow the instructions accompanying the product.

#### X-DFS Double form stop

#### **Product data**

#### **Dimensions**

#### Material specifications

X-DFS: polypropylene

(halogen and silicone free)

grey (RAL 7030), green (RAL 6018), light brown (RAL 8001)

Nails (pre-mounted):

X-C 62: Carbon steel, HRC 56.5,

 $d_{nom}$  = 3.5 mm, zinc coating 5–20  $\mu m$ 

#### Recommended fastening tools

DX 6 F8, DX 5 F8, DX 460 F8,

DX 351 ME, DX 2

 See fastener program in the next pages.

Material specification and material properties for carbon steel elements

#### Nail recommendation for concrete base material

| Nail type | Length | Tip | Shank Ø | Material | Hardness | Coating |
|-----------|--------|-----|---------|----------|----------|---------|
| X-C 62    | 62 mm  | Cut | 3.5 mm  | Carbon   | 56.5 HRC | Zinc,   |
|           |        |     |         | steel    |          | 5–20 µm |

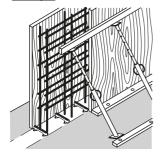

• Two X-C 62 nails are pre-mounted to each X-DFS element.

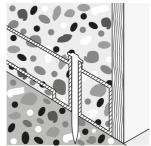

#### **Applications**

#### Example

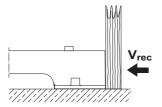

- Positioning concrete forms on concrete surfaces.
- Leave in place formwork spacer, polypropylene is non rusting, nearly invisible and non-conductive.
- Fixed-length form stops for soft concrete base material.

#### Performance data

#### Recommended resistance under shear load

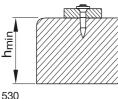

Shear load: V<sub>rec</sub> = 0.4 kN

- Predominantly static, however, vibration from concrete compacting is allowed.
- Valid for soft concrete, medium concrete with strength of f<sub>c, cube</sub> = 25-45 N/mm<sup>2</sup>.
- For more details in relation to base material properties, please refer to the chapter **Fastener selection guide** in the Direct Fastening Technology Manual (DFTM).

#### **Application recommendation**

#### Base material thickness

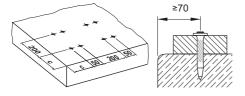

Concrete: h<sub>min</sub> = 80 mm

330 www.hilti.group 04/2021

#### Fastener positioning in base material

Edge distance: c ≥ 70 mm

#### **Corrosion information**

- For temporary fixations no restrictions exist.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

#### System recommendation

• For more details, please refer to the chapter **Accessories and consumables compatibility** in the Direct Fastening Technology Manual (DFTM).

#### Cartridge recommendation

| Base material        | Cartridge color (tool power level) |                          |  |
|----------------------|------------------------------------|--------------------------|--|
|                      | Tool type:                         | Tool type:               |  |
|                      | DX 6 F8                            | DX 5 F8, DX 460 F8,      |  |
|                      |                                    | DX 351 ME, DX 2          |  |
|                      | Cartridge type: 6.8/11 M           | Cartridge type: 6.8/11 M |  |
| Soft/medium concrete | titanium ■ (1-5)                   | green ■, yellow □, red ■ |  |
| Tough concrete       | titanium ■ (4-8)                   | yellow □, red ■          |  |

- Tool power level adjustment by setting tests on site.
- Start tool energy selection with lowest recommended tool power level.
- Correct according requirement from chapter quality assurance.

#### X-EGN, X-GHP, X-GN Fastener for gas-actuated tool

#### **Product data**

#### **Dimensions**

#### X-FGN 14

#### X-GHP 17/20/24

#### X-GN 20/27/32

#### X-GN 39

#### Material specifications

Carbon steel shank: X-EGN HRC 57.5
X-GHP HRC 57.5
X-GN HRC 56.5
Zinc coating: 2–13 µm

#### Recommended fastening tools

GX 120, GX 120-ME GX 100, GX 100 E

 For more details, please refer to X-EGN, X-GHP, X-GN fastener program and to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

#### Approvals

ICC-ESR 1752 (USA): X-GN 20/27/32, X-EGN 14,

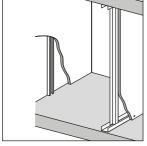

X-GHP 16/17/20/24 IBMB X-GHP, X-GN

 Not all information presented in this product data sheet might be subject to approval/certificate content. Please refer to approval/certificate for further information.

#### **Applications**

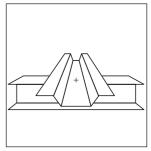

#### Examples

Drywall tracks to concrete and steel

Electrical applications

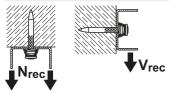

Temporary tacking of composite deck to steel beams

#### Performance data

Recommended resistance under tension and shear load for drywall track fastening

#### X-EGN (Base material: steel)

| Tension N <sub>rec</sub> | Shear V <sub>rec</sub> |
|--------------------------|------------------------|
| 0.4 kN                   | 0.4 kN                 |

#### X-GHP, X-GN (Base material: concrete / sand-lime masonry)

| Embedment | Tension N <sub>rec</sub> |               | Shea            | r V <sub>rec</sub> | Tension N <sub>rec</sub> | Shear V <sub>rec</sub> |
|-----------|--------------------------|---------------|-----------------|--------------------|--------------------------|------------------------|
|           |                          | Concrete Type |                 |                    |                          |                        |
|           | Soft/<br>medium          | Tough         | Soft/<br>medium | Tough              | Sand-lime                | e masonry              |
| ≥ 22 mm   | -                        | -             | -               | -                  | 0.3 kN                   | 0.3 kN                 |
| ≥ 18 mm   | 0.2 kN                   | -             | 0.2 kN          | -                  | 0.2 kN                   | 0.2 kN                 |
| ≥ 14 mm   | 0.1 kN                   | 0.1 kN        | 0.1 kN          | 0.1 kN             | 0.1 kN                   | 0.1 kN                 |

#### Conditions

- For safety relevant fastenings sufficient redundancy of the entire system is required;
   Minimum of 5 nails per fastened track. All visible setting failures must be replaced
- · Sheet metal failure is not considered in recommended loads and must be assessed separately
- Soft, medium concrete up to  $f_{c,cube}$  = 45 N/mm<sup>2</sup> (C35/45), some tough concrete up to  $f_{c,cube}$  = 60 N /mm<sup>2</sup> (C50/60).
- Concrete with aggregate like granite or river rock or softer, and up to 16 mm diameter

#### Stick rate estimation

| Designation | Soft/medium concrete | Tough concrete |
|-------------|----------------------|----------------|
| X-GHP       | 85-98%               | 70-85%         |
| X-GN        | 75–90%               | 55-70%         |

- **a**
- The stick rate indicates the percentage of nails that were driven correctly to carry a load.
- Stick rate can vary from the above values depending on job site conditions.

#### X-EGN 14 MX for temporary tacking of composite decks

| Tension N <sub>rec</sub> | Shear V <sub>rec</sub> |
|--------------------------|------------------------|
| 0.4 kN                   | 0.4 kN                 |

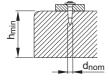

#### Conditions

- The intended use of the fastenings is to secure the deck position and to ensure a safe working platform during the erection state only. The fasteners serve as temporary fixation until the shear connectors of the composite beams are attached.
- At each permanent composite deck support, it is recommended to drive at least one fastener per trough.
- Every deck panel must be fixed at least with two fasteners at every permanent support.
- Single layer sheet with a maximum thickness of 1.25 mm.
- Sheeting grade up to S450 acc. to EN 10346.
- Minimum base material thickness: 6 mm.
- Minimum steel grade: S235 acc. to EN 10025-2.

#### **Application recommendation**

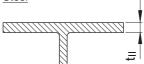

#### Thickness of base material

#### Concrete

 $h_{min} = 60 \text{ mm}$ ( $d_{nom} = 3.0 \text{ mm}$ )

#### <u>Steel</u>

 $t_{II} \ge 4 \text{ mm}$ 

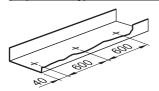

#### Thickness of fastened material

Wooden track:  $t_l \le 25 \text{ mm}$ Metal track:  $t_l \le 2 \text{ mm}$ 

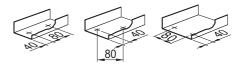

#### Spacing and edge distances (mm)

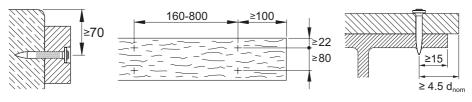

# Spacing along track (as per U.S. Gypsum Handbook)

# All track ends (cut-outs for doors), secure with 2 nails

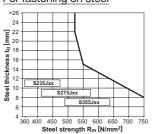

# Distance to edge of concrete / Fastener spacings on wood: sandlime masonry

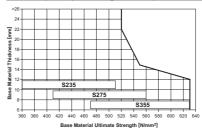

#### Application limits

#### X-EGN 14

#### For fastening on steel

#### For temporary tacking of composite decks

#### Design conditions:

- Single layer sheet with a maximum thickness of 1.25 mm.
- Sheeting grade up to S450 acc. to EN 10346.
- Minimum base material thickness: 6 mm
- Minimum steel grade: S235 acc. to FN 10025-2

#### **Corrosion information**

- The intended use only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

#### Conditions

- For safety relevant fastenings sufficient redundancy of the entire system is required;
   Minimum of 5 nails per fastened track. All visible setting failures must be replaced
- · Sheet metal failure is not considered in recommended loads and must be assessed separately
- Soft, medium concrete up to  $f_{c,cube} = 45 \text{ N/mm}^2$  (C35/45), some tough concrete up to  $f_{c,cube} = 60 \text{ N/mm}^2$  (C50/60).
- Concrete with aggregate like granite or river rock or softer, and up to 16 mm diameter

#### Stick rate estimation

| Designation | Soft/medium concrete | Tough concrete |
|-------------|----------------------|----------------|
| X-P G3      | 85-98%               | 70-85%         |
| X-C G3      | 75–90%               | 55-70%         |

- **a**
- The stick rate indicates the percentage of nails that were driven correctly to carry a load.
  - Stick rate can vary from the above values depending on job site conditions.

# Application recommendation

#### Thickness of base material

Concrete (for nails and threaded studs) h<sub>min</sub> = 60 mm

 $\frac{\text{Steel}}{t_{||} \ge 4.0 \text{ mm (for nails)}}$   $t_{||} \ge 6.0 \text{ mm (for threaded studs)}$ 

#### Thickness of fastened material

 $\label{eq:wooden track:} Wooden track: \qquad \qquad t_{\parallel} \leq 25 \text{ mm}$   $\label{eq:wooden} \text{Metal track:} \qquad \qquad t_{\parallel} \leq 2 \text{ mm}$ 

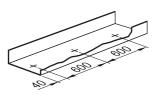

Deflection head:

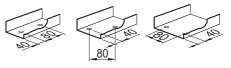

t<sub>l.tot.</sub> ≤ 21 mm (gypsum strip + metal track and sealant)

#### Spacing and edge distances (mm)

# Spacing along track

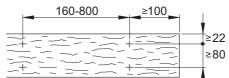

All track ends (cut-outs for doors), secure with 2 nails

Fastener spacing max. 30 cm for proprietary light non-load-bearing partition walls with fire classification

<u>Distance to edge of concrete /</u> sand-lime masonry

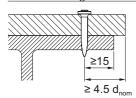

≥70

# Spacing between nails when fastening wood to concrete

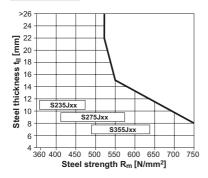

Distance to edge of fastened material (steel base material)

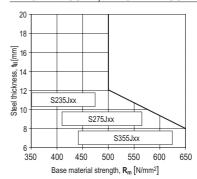

#### Application limits

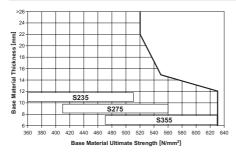

# X-S 14 G3 MX

#### X-M6-7-14 G3 P7, X-W6-12-14 G3 P7

#### For temporary tacking of composite decks

#### Design conditions

- Single layer sheet with a maximum thickness of 1.25 mm.
- Sheeting grade up to S450 acc. to EN 10346.
- · Minimum base material thickness: 6 mm
- Minimum steel grade: S235 acc. to EN 10025-2

#### **Corrosion information**

- The intended use only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres, i.e. only intended for dry indoor areas.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

| ≥ 22 mm   | -      | -                  | -                      | -      | 0.3 kN                   | 0.3 kN                 |
| ≥ 18 mm   | 0.2 kN | -                  | 0.2 kN                 | -      | 0.2 kN                   | 0.2 kN                 |
| ≥ 14 mm   | 0.1 kN | 0.1 kN             | 0.1 kN                 | 0.1 kN | 0.1 kN                   | 0.1 kN                 |

#### Conditions

- For safety relevant fastenings sufficient redundancy of the entire system is required;
   Minimum of 5 nails per fastened track. All visible setting failures must be replaced
- · Sheet metal failure is not considered in recommended loads and must be assessed separately
- Soft, medium concrete up to  $f_{c,cube}$  = 45 N/mm² (C35/45), some tough concrete up to  $f_{c,cube}$  = 60 N/mm² (C50/60).
- Concrete with aggregate like granite or river rock or softer, and up to 16 mm diameter

#### Stick rate estimation

| Designation | Soft/medium concrete | Tough concrete |
|-------------|----------------------|----------------|
| X-P G2      | 85-98%               | 70-85%         |
| X-C G2      | 75-90%               | 55-70%         |

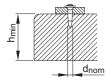

- The stick rate indicates the percentage of nails that were driven correctly to carry a load.
- Stick rate can vary from the above values depending on job site conditions.

# **Application recommendation**

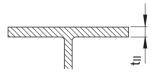

#### Thickness of base material

#### Concrete

 $h_{min} = 60 \text{ mm}$ ( $d_{nom} \le 3.0 \text{ mm}$ )

#### Steel

 $t_{||} \ge 4.0 \text{ mm (for nail)}$ 

#### Thickness of fastened material

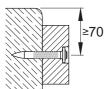

Wooden track:  $t_l \le 25 \text{ mm}$ Metal track:  $t_l \le 2 \text{ mm}$ 

# Spacing and edge distances (mm)

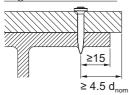

#### Spacing along track

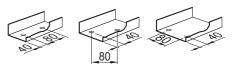

# Edge distance for concrete/sand-lime masonry

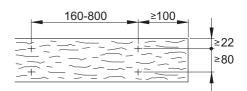

#### Edge distance for steel

# All track ends (cut-outs for doors), secure with 2 nails

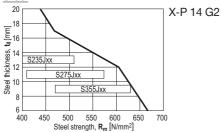

## Fastener spacing on wood

#### Application limits

#### Steel

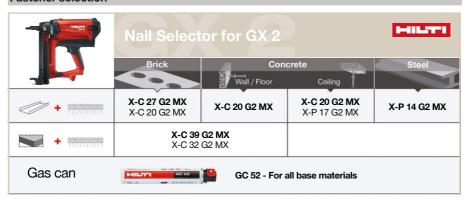

#### **Corrosion information**

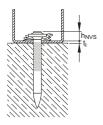

- The intended use only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

#### **Fastener selection**

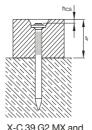

#### **Quality assurance**

#### Nails in concrete / sand-lime masonry

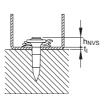

X-C/X-P G2 MX:  $h_{NVS} = 2-5$  mm

X-C 39 G2 MX and X-C 32 G2 MX: h<sub>CS</sub> = 2-3 mm

#### Nails in steel

X-P 14 G2 MX:  $h_{NVS} = 2-9 \text{ mm}$ 

# BX 3 System Fastener for interior finishing, building construction, mechanical and electrical application

#### **Product data**

#### Product description

BX 3-ME-22

BX 3-22, BX 3-L-22

- Hilti's combustion-free direct fastening technology for driving nails into concrete, steel and some types of solid masonry
- High user comfort thanks to low levels of compression force, noise and recoil
- No disposal of (used) propellant cartridges or gas cans
- Hilti's 22V NURON platform

#### **Applications**

#### For fastenings with nails

Drywall tracks to concrete and steel

Fastening wood, e.g. Placopan®, to concrete

Junction boxes, switch boxes, etc

#### For fastenings with elements

Flexible or rigid cable conduits with cable ties

Fastening cables

Cable conduits or light-duty pipes

 Not all information presented in this product data sheet might be subject to approval/certificate content. Please refer to approval/certificate for further information.

#### **Applications**

#### Environmental conditions

Dry indoor

- The intended use comprises fastening in dry conditions.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

# B 3 nails for fastening to concrete and steel

# **Application recommendation** Fastened material properties and fastener positioning in fastened material Deflection head t<sub>l. tot</sub> ≤ 21 mm (gypsum strip +metal track and sealant) t₁≤2 mm Metal track Wooden track $t_1 \le 27 \text{ mm}$ (conditions: head of the nail is countersunked flat to the surface) Base material properties and fastener positioning in base material Base material Steel Base material thickness till ≥ 4 mm Base material Concrete 60 mm Base material thickness h<sub>min</sub>

• For more details in relation to base material properties, please refer to the chapter Fastener selection guide in the Direct Fastening Manual (DFTM).

#### Spacing and edge distances (mm)

#### Max. spacing along track

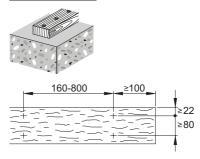

# All track ends (cut-outs for doors), secure with 2 nails

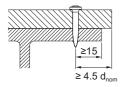

# Edge distance for fastening to concrete / sand-lime masonry

# Spacing between nails for fastening wood to concrete

# Edge distance for fastening to steel

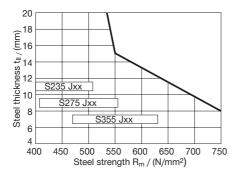

- Fastener spacing max. 300 mm for proprietary light non-load-bearing partition walls with fire classification.
- Based on common practice, spacing needs to be adjusted based on specific load requirement and achieved embedment depth.
- All dimensions in mm.

# For fastening to steel with X-S 14 B3 MX

# Application limitation for fastening on steel

#### Performance data

Recommended resistance under tension and shear load

| Designation  | Tension load     | Shear load       |
|--------------|------------------|------------------|
|              | N <sub>rec</sub> | V <sub>rec</sub> |
| X-S 14 B3 MX | 0.40 kN          | 0.40 kN          |

Recommended resistance under shear load for track fastening

| Designation  | Embedment depth | Shear load       |
|--------------|-----------------|------------------|
|              | h <sub>ET</sub> | V <sub>rec</sub> |
| X-P 17 B3 MX | ≥ 11 mm         | 0.38 kN          |
| X-P 20 B3 MX | 2               | 0.36 KN          |

#### For fastening to concrete and sand-lime masonry with X-P B3, X-C B3

#### Recommended resistance under tension and shear load

| Embedment<br>depth<br>hET | Tension load<br>N <sub>rec</sub> | Nrec     | Shear load<br>V <sub>rec</sub> | Vrec     |
|---------------------------|----------------------------------|----------|--------------------------------|----------|
|                           | Soft/medium                      | Tough    | Soft/medium                    | Tough    |
|                           | concrete                         | concrete | concrete                       | concrete |
| ≥ 14 mm                   | 0.10 kN                          | 0.10 kN  | 0.10 kN                        | 0.10 kN  |
| ≥ 18 mm                   | 0.20 kN                          | -        | 0.20 kN                        | -        |
|                           | Sand-lime maso                   | nry      | Sand-lime masonry              |          |
| ≥ 14 mm                   | 0.10 kN                          |          | 0.10 kN                        |          |
| ≥ 18 mm                   | 0.20 kN                          |          | 0.20 kN                        |          |
| ≥ 22 mm                   | 0.30 kN                          |          | 0.30 kN                        |          |

- Redundancy of fastening points is required.
- Minimum number of fastening points for safety relevant fastenings: ≥ 5.
- Sheet metal failure is not considered in recommended loads and must be assessed separately.

#### Stick rate estimation

| Designation | Soft/medium | Tough    |
|-------------|-------------|----------|
|             | concrete    | concrete |
| X-P B3      | 85-98%      | 70-85%   |
| X-C B3      | 75-90%      | 55-70%   |

- The stick rate indicates the percentage of nails that were driven correctly to carry a load.
- Stick rate can vary from the above values depending on job site conditions.

#### System recommendation

• For more details, please refer to the chapter **Accessories and consumables compatibility** in the Direct Fastening Technology Manual (DFTM).

- ullet Fastener stand-off  $h_{NVS}$  for X-ET MX is measured against the cable trunk.
- Visible setting failures must be replaced with a new fastener, not in the same hole.
- These are abbreviated instructions which may vary by application.
- Always review/follow the instructions accompanying the product.

#### **Fastener program**

Item no. and description

 Item no. and description is provided in the corresponding Product Data Sheet(s) for element(s).

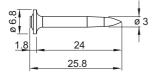

# **BX-Kwik Electrical hanger system**

#### **Product data**

#### X-EHS MX

X-P 24 B3 MX

#### Features and benefits

A special hanger system with pre-drilled pilot hole optimized for higher load and close to 100% stick rate for applications on soft & tough concrete.

#### **General information**

#### The system consists of:

- X-EHS MX hangerX-P 24 B3 MX nail
- TX-C-5/10B drill bit
- BX 3 ME

#### **Material Specifications**

Hanger:

Zinc coating ≥ 10 mm

Nail:

Carbon Steel 57.5 HRC Zinc Coating 2-10 µm

## **Applications**

#### Examples

Threaded rod attachments to concrete

Cable trays

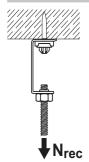

Small pipes

These zinc coated fasteners are not suitable for long-term service outdoors or in otherwise corrosive environments. For further detailed information on corrosion see chapter **Direct Fastening Principles and Technique**.

These fasteners are not recommended for fastening of suspended ceilings.

#### Performance data on concrete

| Recommended Tension Load N <sub>rec</sub> [kN] |       |  |
|--|-------|--|
| Concrete Toughness 1)                          |       |  |
| Soft   | Tough |  |
| 0.3  | 0.45  |  |

| Stick rate estimation 1) |                |  |
|--------------------------|----------------|--|
| Soft Concrete            | Tough Concrete |  |
| 95-100 %                 | 95-100 %       |  |

#### **Conditions:**

- A sufficient redundancy has to be ensured, that a failure of a single fastening will
  not lead to collapse of the entire system.
- Soft concrete up to  $f_{c,cube} = 45 \text{ N/mm}^2 \text{ (C35/45)}$ .
- Tough concrete up to f<sub>c.cube</sub> = 60 N/mm<sup>2</sup> (C50/60).
- Concrete with aggregate like granite or river rock or softer, and up to 16 mm diameter.
- Loads valid for cracked and uncracked concrete.

<sup>1)</sup> The stick rate indicates the percentage of nails that were driven correctly to carry a load. Stick rate can vary from the above value depending on job site conditions. For more details regarding fastener behaviour and concrete types, please refer to **Concrete Fastener Selection** section.

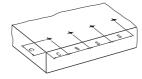

#### **Application requirements**

#### Thickness of base material

Concrete:

 $h_{min} = 60 \text{ mm}$ 

#### Edge distance and fastener spacing

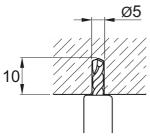

Edge distance: c ≥ 70 mm Spacing: s ≥ 100 mm

#### Installation

## **Pre-drilling details**

Pre-drilling with Hilti drill bit **TX-C-5/10B** until a ring on the concrete surface is visible.

#### Fastener positioning

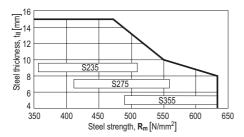

Minimum spacing and edge distances: See corresponding nail data sheet of X-U and X-DKH.

# Application limits

# Fastening to steel - X-HS U19 with DX351

Application limit may increase in case of specific applications, like the fastening of wire mesh to steel, which is connected with X-CC U16 P8 fasteners. That wire mesh acts as reinforcement for fire protective sprayed coating. In such cases also different fastener stand-offs apply. Inquire at Hilti related with the use of X-CC U16 P8 in that specific application.

#### **Corrosion information**

- These zinc-coated fasteners are not suitable for long-term service outdoors or in otherwise corrosive environments.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

# System recommendation

• For more details, please refer to the chapter **Accessories and consumables compatibility** in the Direct Fastening Technology Manual (DFTM).

- Tool power level adjustment by setting tests on site.
- Start tool energy selection with lowest recommended tool power level.
- Correct according requirement from chapter quality assurance.

# **Quality assurance**

#### Installation

#### X-HS

Attach the threaded rod to the X-HS before fastening

2. For DKH 48 pre-drill (Ø 5 x 23)

3. Load the assembly into the tool

4.
Locate the nail,
compress the tool,
pull the trigger and
the fastening is
complete

5.
Bend the X-HS
assembly down
to the vertical
position

#### X-CC

1. Assemble the wire with the X-CC

2. For DKH 48 pre-drill (Ø 5 x 23)

3. Load the assembly into the tool

4. Locate the nail, compress the tool, pull the trigger and the fastening is complete

5. Adjust the wire as required

# Setting depth control

# X-HS

 $h_{NVS} = 6-10 \text{ mm}$ 

 $h_{NVS} = 4-7 \text{ mm}$   $h_{NVS} = 6-10 \text{ mm}$ 

These are abbreviated instructions which may vary by application.

**ALWAYS** review/follow the instructions accompanying the product.

# **Fastener program**

# X-MW MX, X-MW ALH Wire hanging system

Technology:

X Direct Fastening (DX) solution

Fastening system:

MW MX Wire hanging system fastened with battery-actuated

magazined fastener

MW ALH Wire hanging system with pre-mounted powder-actuated

fastener

Fastening type:

MX Magazined fastener
ALH Pre-mounted fastener

Lock type:

L Loop lock

#### **Product data**

# Product description

- X-MW MX fastening system for fastening heating, ventilation, and air condition (HVAC), cable tray, conduit rack and lighting to ceiling
- System can be mounted with battery-actuated fasteners
   X-P 20 B3 MX, X-P 24 B3 MX, X-S 14 B3 MX
- Wire length: 2 m, 3 m and 6 m
- Loop lock

- X-MW ALH fastening system for fastening heating, ventilation, and air condition (HVAC), cable tray, conduit rack and lighting to ceiling
- System can be mounted with powder-actuated pre-mounted fasteners X-ALH 22/27/32
- Wire length: 2 m, 3 m and 6 m
- · Loop lock

X-S 14 B3 MX

# **Applications**

## Example

- Hanger systems for light cable trays, etc. threaded rod attachments, wire attachments
- These fasteners are not recommended for fastening of suspended ceilings.
- These zinc coated fasteners are not suitable for long-term service outdoors or in otherwise corrosive environments.

Performance data

# Recommended resistance under tension and shear load on concrete

| Designation | N <sub>rec</sub> | V <sub>rec</sub> |
|-------------|------------------|------------------|
| X-EHS MX    | 0.1 kN           | 0.1 kN           |
| X-ECC MX    | 0.05 kN*         | 0.1 kN           |

<sup>\*)</sup> eccentric loading considered

#### Conditions

- Fastened with X-P 20/24 G3 MX, X-P 20/24 B3 MX, X-GHP 20/24 MX, X-U 22 or X-P 22.
- Minimum 5 fastenings per fastened unit (normal weight concrete).
- All visible failures must be replaced.
- With lightweight concrete base material and appropriate washers, greater loading may be possible, please contact Hilti.
- · Predominantly static loading.
- Observance of all application limitations and recommendations.

• For more details in relation to base material properties, please refer to the chapter **Fastener selection guide** in the Direct Fastening Manual (DFTM).

#### Recommended resistance under tension and shear load on steel

Ceiling clip

# X-DHS MX Pipe support system

#### **Product data**

#### **Dimensions**

X-DHS 3/8" MX

#### Features and benefits

- Securely fastened threaded rod hangers to steel and concrete (soft and tough) base material
- Easy installation of threaded rods on floors, walls and ceiling

## **General information**

Material specification

X-DHS:

Zinc coating 10-20 µm

# **Applications**

#### Example

Hanger system for:

- Light-duty fastenings of pipes on ceilings
- Supporting pipes on floors
- Positioning of vertical pipes on walls

These fasteners are not recommended for fastening of suspended ceilings.

These zinc coated fasteners are not suitable for long-term service outdoors or in otherwise corrosive environments.

## **Design conditions:**

- Each X-DHS MX element has to be fastened with 2 nails
- · All visible failures must be replaced.
- · Predominantly static loading.
- Valid for soft and tough concrete with strength of f<sub>C, cube</sub> = 25-60 N/mm<sup>2</sup>. For more details regarding concrete types, please refer to Concrete Fastener Selection section in Hilti Direct Fastening Technology Manual (DFTM).
- Observance of all application limitations and recommendations.

Recommended load per X-DHS MX element (fastened with 2 Nails)

- For wall application (i.e. vertical pipes on walls), X-DHS MX is used for positioning purpose only, with NO imposed loading.
- Maximum spacing = 100 cm

| Recommended loads (Base material = steel) |                       |

- For X-DHS MX element, only 24 mm length nails are recommended for concrete base material to ensure sufficient embedment depth.
- Premium nails (as listed above) are the only recommended nails based on intended use of X-DHS element (soft and some tough concrete, GX/BX tools). For more details regarding nail classification and concrete types, please refer to **Concrete Fastener** Selection section in Hilti Direct Fastening Technology Manual (DFTM).

| For steel base material |            |                |          |                 |          |                   |                 |

X-HS-W MX 3m/10ft

- No lifting: do not use for lifting, such as in a crane or pully situation.
- No movement: Hilti hangers are to be used to suspend stationary loads only. Do not use to suspend moving services, or services likely to be subject to movement.
- No joining: Hilti hangers must not be used as an in-line joint using a Hilti fastener, or any other joining device. A Hilti hanger assembly must comprise one length of cable and one Hilti fastener only. If a longer length is needed, do not join two assemblies together.

# X-DFC Double fire clip

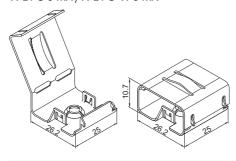

# **Product data**

#### **Dimensions**

X-DFC 8 MX/ X-DFC-W 8 MX

X-DFC 9 MX / X-DFC-W 9 MX

#### Features and benefits

- Easy and convenient installation to concrete (soft and some tough) and sandlime stone base material
- · Quick, cost-efficient fastening
- Can be clicked on BX fastener guide, no adaptor needed
- Tested by an external, certified test institute

# **General information**

## Material specifications

X-DFC-MX:

Stainless steel with 50 µm red or white colour coating

# Approval and standards

Product qualification according to BS EN 50200, BS EN 50200 Annex E and BS 8434-2

In compliance with cable support requirements of BS 5839-1, BS 5839-8 and BS 5266-1

# **Applications**

Installation of fire alarm and emergency lighting cables.

# Performance data

# Fire rating

#### Conditions:

- · Pre-loading of the elements after setting
- All visible failures must be replaced.
- Observance of all application limitations and recommendations.

Recommended fastener spacing a: horizontal ≤ 300 mm, vertical ≤ 400 mm

# Fastener selection and system recommendation

# **Fastener program**

| Designation  | Item no. | Colour | Cable diameter    |
|--------------|----------|--------|-------------------|
| X-DFC 8 MX   | 2143695  | Red    | 8 mm ≤ D ≤ 8.5 mm |
| X-DF-W 8 MX  | 2143699  | White  |                   |
| X-DFC 9 MX   | 2143696  | Red    | 8.5 mm ≤ D ≤ 9 mm |
| X-DFC-W 9 MX | 2143730  | White  | 0.5               |

#### **Tool selection**

X-P B3 MX: BX 3-ME No gas can required

X-P G3 MX: GX 3-ME Gas can GC 40, GC 41 and GC 42

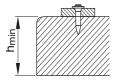

#### Nail recommendation

| Fastening tool | Nail types | Length<br>[mm] | Tip     | Shank Ø<br>[mm] | Material | Hardness<br>[HRC] | Coating [µm] |
|----------------|------------|----------------|---------|-----------------|----------|-------------------|--------------|
| BX3-ME         | X-P B3 MX  | 17 00          | Long-   | 3.0             | Carbon   | 57.5              | Zinc, 2-13   |
| GX3-ME         | X-P G3 MX  | 17 - 20        | conical |                 | steel    | 57.5              | Zinc, 2-13   |

- For the X-DFC MX element, only 17 mm and 20 mm pin lengths are recommended in order to ensure sufficient embedment depth.
- Nails (as listed above) are recommended for wall and ceiling application (soft and some tough concrete and sandlime stone, GX/BX tools). For more details regarding nail classification and concrete types, see Concrete Fastener Selection chapter in Direct Fastening Technology Manual (DFTM).

#### **Application requirements**

#### Thickness of base material

$$h_{min} = 60 \text{ mm}$$

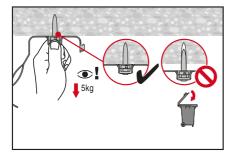

# **Edge distance**

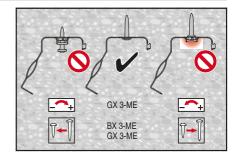

Min. edge distance = 70 mm

# **Corrosion information**

Zinc-coated nails are not suitable for long-term service outdoors or in otherwise corrosive environments. For further detailed information on corrosion see relevant chapter in Direct Fastening Principles and Technique section.

 Not all information presented in this product data sheet might be subject to approval/certificate content. Please refer to approval/certificate for further information.

# **Applications**

Fastening (Type 2)

#### Base materials

Soft concrete

Standard concrete

Tough concrete

Sand lime masonry

Load conditions

Static/ quasi static

Fire resistance

# Fastening position (Type 2)

Battery-actuacted fastener

Anchor

# Fastener and achor setting and installation information

- Fastener and anchor setting information (e.g. base material properties, fastened material properties and setting energy) and installation information (e.g. quality assurance) are part of the corresponding Product Data Sheet for fasteners and anchors.
- Fastener guide X-FG B3-ME recommended for fastener setting with batteryactuated tool. Holding the cable holder by hand no longer necessary.
- Visible setting failures must be replaced with a new fastener, not in the same hole.
- These are abbreviated instructions which may vary by application.
- Always review/follow the instructions accompanying the product.

# X-FB Electrical conduit fastener

#### **Product data**

#### Product description

#### X-FB MX

- Quick, cost-efficient fastening of conduits and pipes
- Friction-fit in the nose of BX/GX/DX nailers for easy handling
- Bracing rib for high rigidity and a tight, secure hold on flexible conduits
- Engineered for high-quality, reliable fastening
- · Virtually dust-free fastening

- · Quick, cost-efficient fastening of conduits and pipes
- Integrated top hat for high-quality, more reliable fastenings
- High-grade, preassembled C27 nail for more secure fastenings on concrete
- · Reinforcing rib to increase the conduit clip's rigidity

#### **Applications**

Fastening conduits to concrete

Fastening conduits to steel

#### Base materials

Steel

Soft Medium Tough concrete concrete

#### Load conditions

Static/ quasi static

#### **Environmental conditions**

Dry indoor

- The intended use comprises fastening in dry conditions or temporary outdoor conditions
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

# X-FB Electrical conduit fastener - Fastening to concrete

#### **Application recommendation**

Fastened material properties

Fastening conduits and pipes with  $5 \le \emptyset \le 50$  mm.

#### Base material properties and fastener positioning in base material

|   | Base material  | Concrete               |
|---|--|------------------------|
|   | Base material thickness h <sub>min</sub>                 | 80 mm                  |
| ٩ |  | (powder-actuated)      |
|   | Base material thickness h <sub>min</sub>                 | 60 mm                  |
| , |  | (battery/gas-actuated) |
|   | Edge distance c <sub>1,min</sub> , c <sub>2,min</sub>    | 70 mm                  |
|   | Fastener spacing s <sub>1.min</sub> , s <sub>2.min</sub> | 100 mm                 |

#### Performance data

| Designation         | Nail length    | Tension load     |          |
|---------------------|----------------|------------------|----------|
|                     | L <sub>s</sub> | N <sub>rec</sub> |          |
|                     |                | Soft/medium      | Tough    |
|                     |                | concrete         | concrete |
| X-FB MX + X-X       | 22-27 mm       | 0.06 kN          | 0.06 kN  |
| X-FB MX + X-P, X-U  | 22-27 mm       | 0.06 kN          | 0.06 kN  |
| X-FB MX + X-C       | 22–27 mm       | 0.06 kN          | 0.06 kN  |
| X-FB MX + X-P B3 MX | 20-24 mm       | 0.02 kN          | 0.02 kN  |
| X-FB MX + X-P G3 MX | 20-24 mm       | 0.02 kN          | 0.02 kN  |
| X-FB-C 27           | 27 mm          | 0.06 kN          | 0.06 kN  |

- Redundancy of fastening points is required.
- Minimum number of fastening points for safety relevant fastenings: ≥ 5.
- For more details, please refer to the chapter Fastener selection guide in the Direct Fastening Technology Manual (DFTM).

#### Stick rate estimation

| Designation             | Soft/medium | Tough    |
|-------------------------|-------------|----------|
|                         | concrete    | concrete |
| X-FB MX + X-X           | 90-99%      | 85-90%   |
| X-FB MX + X-P, X-U, X-C | _           | _        |
| X-FB MX + X-P B3 MX     | 85-98%      | 70-85%   |
| X-FB MX + X-P G3 MX     | 75-90%      | 55-70%   |
| X-FB-C 27               | _           | _        |

- The stick rate indicates the percentage of nails that were driven correctly to carry a load.
- Stick rate can vary from the above values depending on job site conditions.

#### System recommendation

 For more details, please refer to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

• For more details in relation to base material properties, please refer to the chapter **Fastener selection guide** in the Direct Fastening Manual (DFTM).

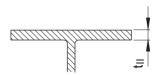

#### **Application recommendation**

Base material thickness

| Concrete              |                          |
|-----------------------|--------------------------|
| X-U, X-P or X-C       | h <sub>min</sub> = 80 mm |
| X-P B3 MX, X-P G3 MX, | h <sub>min</sub> = 60 mm |
| X-GHP, X-C 27 G3 MX,  |                          |
| X-GN 27 MX            |                          |
|                       |                          |

t<sub>II</sub> ≥ 4 mm

#### Fastened material thickness

X-BX, X-EMTC

To fasten conduits, pipes and tubes of Ø 5 mm to 50 mm

#### Fastener positioning

Space fastenings as needed to control sag and maintain alignment.

#### **Corrosion information**

- These zinc-coated fasteners are not suitable for long-term service outdoors or in otherwise corrosive environments.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

#### System recommendation

• For more details, please refer to the chapter **Accessories and consumables compatibility** in the Direct Fastening Technology Manual (DFTM).

# X-FB-E, X-DFB-E Electrical conduit fastener

# **Product data**

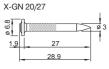

#### **Dimensions**

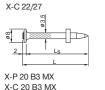

X-DFB-E

X-GHP 20

X-P 20 G3 MX

# Material specifications

Galvanized steel sheet

 $f_u = 270-420 \text{ N/mm}^2$ 10-20 µm zinc coating

Recommended fastening tools DX 6 MX, DX 5 MX, DX 460 MX, DX 351 MX, DX 6 F8, DX 5 F8, DX 351 F8, DX 460 F8, GX 120 ME, GX 3 ME, BX 3 ME

 See fastener program in the next pages.

# **Applications**

#### Example

X-FB-E for rigid conduits

X-FB-E for flexible conduits

#### Performance data

#### Recommended resistance under tension load

|   | Concrete         | Sandlime stone   |

 For more details in relation to base material properties, please refer to the chapter Fastener selection guide in the Direct Fastening Manual (DFTM).

#### **Application recommendation**

#### Base material thickness

X-GN, X-GHP, X-C G3 MX, X-P G3 MX:  $h_{min} = 60 \text{ mm}$  X-C B3 MX, X-P B3 MX:  $h_{min} = 60 \text{ mm}$  X-C:  $h_{min} = 80 \text{ mm}$ 

#### Fastened material thickness

X-FB-E: To fasten conduits, pipes and tubes of Ø 16 mm to 25 mm X-DFB-E: To fasten conduits, pipes and tubes of Ø 20 mm to 25 mm

#### Fastener positioning

Space fastenings as needed to control sag and maintain alignment.

#### **Corrosion information**

- These zinc-coated fasteners are not suitable for long-term service outdoors or in otherwise corrosive environments.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

#### System recommendation

 For more details, please refer to the chapter Accessories and consumables compatibility in the Direct Fastening Technology Manual (DFTM).

#### Cartridge recommendation for fastening to concrete and masonry

| Base material        | Cartridge color (tool power level) |                          |  |  |  |
|----------------------|------------------------------------|--------------------------|--|--|--|
|                      | Tool type:                         | Tool type:               |  |  |  |
|                      | DX 6 MX                            | DX 5 MX, DX 460 MX,      |  |  |  |
|                      |                                    | DX 351 MX                |  |  |  |
|                      | DX 6 F8                            | DX 5 F8, DX 460 F8,      |  |  |  |
|                      |                                    | DX 351 F8, DX 2          |  |  |  |
|                      | Cartridge type: 6.8/11 M           | Cartridge type: 6.8/11 M |  |  |  |
| Sand lime masonry    | titanium ■ (1-5)                   | green ■, yellow □        |  |  |  |
| Soft/medium concrete | titanium ■ (2-5)                   | yellow □, red ■          |  |  |  |
| Tough concrete       | titanium ■ (4-7)                   | yellow □, red ■          |  |  |  |

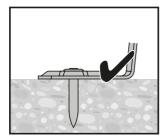

- Tool power level adjustment by setting tests on site.
- Start tool energy selection with lowest recommended tool power level.
- Correct according requirement from chapter quality assurance.

#### System recommendation for gas-actuated and battery-actuated tools

| GX tools | GX 120-ME | Gas can GC 20, GC 21 and GC 22 |
|----------|-----------|--------------------------------|
|          | GX 3-ME   | Gas can GC 40, GC 41 and GC 42 |
| BX tools | BX 3-ME   | No gas can required            |

#### **Quality assurance**

X-C G3 MX, X-P G3 MX: GX 3 ME
X-C B3 MX, X-C B3 MX BX 3 ME

X-C\_P8: DX 6 F8, DX 5 F8, DX 460 F8, DX 351 F8
X-C\_MX: DX 6 MX, DX 5 MX, DX 460 MX, DX 351 MX

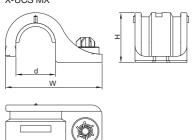

# X-UCS MX Universal conduit saddle

#### **Product data**

#### **Dimensions**

X-UCS MX

#### Features and benefits

- •• Easy and convenient installation to concrete (soft and tough) and sandlime stone base material
- · · Quick, cost-efficient fastening

#### **General information**

#### Material specification

X-UCS: P

PE (halogen and silicone

free), light grey RAL

7035, free

# **Applications**

#### Example

- Fastening flexible pipes and pipes with foam insulation for water and heating
- Fastening insulated injection hoses

The intended use only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres.

#### Load data

#### Recommended loads (Base material = concrete)

| Fastener | Concrete / Sandlime stone N <sub>rec</sub> [kN] |
|----------|---|
| X-UCS MX | 0.011   |

#### **Design conditions:**

- For pipes fastened with less than 5 fasteners and without any fixed end support, a test load has to be applied to each fastener, see Instruction For Use.
- All visible failures must be replaced.
- · Predominantly static loading.
- Valid for soft and tough concrete with strength of f<sub>c, cube</sub> = 25-60 N/mm<sup>2</sup>, that may contain medium sized aggregate e.g. limestone, pit gravel. please refer to Concrete Fastener Selection section in Hilti Direct Fastening Technology Manual (DFTM).
- · Valid for sandlime stone.
- Observance of all application limitations and recommendations.
- Long-term behavior of X-UCS MX plastic material considered.

#### **Fastener capacity**

| Fastening designation | Pipe diameter [mm] | Recommended fastener spacing on ceilings and walls [cm] |
|-----------------------|--------------------|---|
| X-UCS 19 MX           | 19.0               | 80  |
| X-UCS 23 MX           | 23.0               | 60  |
| X-UCS 27.5 MX         | 27.5               | 40  |
| X-UCS 30.5 MX         | 30.5               | 30  |

#### Comments:

 Recommended fastener spacing is based on recommended load and average weight of intended pipes during duty

#### **Nail recommendations**

| For concrete base material |            |                |                  |                 |          |                   |                 |               |
|----------------------------|------------|----------------|------------------|-----------------|----------|-------------------|-----------------|---------------|
| Fastening tool             | Nail types | Length<br>[mm] | Tip              | Shank<br>Ø [mm] | Material | Hardness<br>[HRC] | Coating<br>[µm] |               |

| GX 3 ME                    | X-P G3 MX  |                | 20 - 24 Balistic | Balistic        | 3.0      | Carbon<br>steel   | 57.5            | Zinc, 2-13 μm |
| GX120                      | X-GHP MX   |                |                  |                 | 0.00.    | 57.5              | Zinc, 2-13 μm   |               |

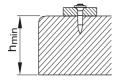

- •• For the X-UCS MX element, only 20 mm and 24 mm pin lengths are recommended in order to ensure sufficient embedment depth.
- Premium nails (as listed above) are recommended for wall and ceiling application (soft and some tough concrete and sandlime stone, GX/BX tools). For more details regarding nail classification and concrete types, please refer to Concrete Fastener Selection section in Hilti Direct Fastening Technology Manual (DFTM).

BX 3-ME No gas can required

#### Fastening quality assurance

# X-UCS-S MX Universal conduit saddle for rigid pipe

#### **Product data**

#### **Dimensions**

X-UCS-S MX

#### Features and benefits

The X-UCS-S MX enables easy and convenient installation to concrete floor (soft and some tough concrete).

#### **General information**

Material specification

X-UCS-S MX: HDPE

HDPE (halogen and silicon free), light grey RAL 7035

# **Applications**

#### Example

• Fastening rigid pipes and smooth surface pipes (without foam or grooved protection layer) for water and heating.

The intended use only comprises fastenings which are not directly exposed to external weather conditions or moist atmospheres.

#### Performance data

| Fastener   | Concrete / Sandlime stone<br>V <sub>rec</sub> [kN] |
|------------|--|
| X-UCS-S MX | 0.02   |

#### **Design conditions:**

- For pipes fastened with less than 5 fasteners and without any fixed end support, a test load has to be applied to each fastener, see Instruction For Use.
- All visible failures must be replaced.
- · Predominantly static loading.
- Valid for soft and some tough concrete with strength of f<sub>c,cube</sub> = 25-60 N/mm<sup>2</sup>, that may contain medium sized aggregate e.g. limestone, pit gravel. Please refer to Concrete Fastener Selection section in Hilti Direct Fastening Technology Manual (DFTM).
- Observance of all application limitations and recommendations.
- Long-term behavior of X-UCS-S MX plastic material considered.

| Stick rate estimation        |           |           |  |  |  |  |
|------------------------------|-----------|-----------|--|--|--|--|
| Soft Concrete Tough concrete |           |           |  |  |  |  |
| X-P B3                       | 85% - 98% | 70% - 85% |  |  |  |  |
| X-C B3                       | 75% - 90% | 55% - 70% |  |  |  |  |

• The stick rate indicates the percentage of nails that were driven correctly to carry a load. Stick rate can vary from the above values depending on job site conditions.

#### Nail recommendations

• See fastener program in the next pages.

# Approvals and certificates

CSTB (France) X-ECT MX, X-EKS MX, X-EKSC MX (all with X-U22 MX nail)

UL (USA) X-ECT MX

Not all information presented in this product data sheet might be subject to approval / certificate content. Please refer to approval/certificate for further information.

#### **Applications**

#### Examples

Rigid conduits

Cable conduits or light duty pipes

#### Performance data

Recommended tension and shear load for fastening electrical elements

| Designation                           | Tension load N <sub>rec</sub> | Shear load V <sub>rec</sub> |  |  |
|---------------------------------------|-------------------------------|-----------------------------|--|--|
| X-ECT 40 MX,<br>X-ECT MX, X-ECT FR MX | 0.040 kN                      | 0.040 kN                    |  |  |
| X-UCT MX                              | 0.040 kN                      | 0.040 kN                    |  |  |
| X-EKS MX                              | 0.011 kN                      | 0.011 kN                    |  |  |
| X-EKSC MX                             | 0.032 kN                      | 0.032 kN                    |  |  |

#### Recommended tension and shear load for fastening pipes

| Designation                           | Tension load N <sub>rec</sub> | Shear load V <sub>rec</sub> |
|---------------------------------------|-------------------------------|-----------------------------|
| X-ECT 40 MX,<br>X-ECT MX, X-ECT FR MX | 0.040 kN                      | 0.040 kN                    |
| X-EKSC MX                             | 0.032 kN                      | 0.032 kN                    |

- copper pipes and plastic pipes, e.g. PEX pipes
- pipes filled with 90°C hot fluid
- tests according to Kiwa standard BRL-K506

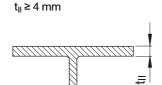

#### Base material thickness

 $\begin{tabular}{lll} Concrete & & & \\ X-U, X-P: & & h_{min} = 80 \ mm \end{tabular}$ 

X-P B3 MX:  $h_{min} = 60 \text{ mm}$ X-P G3 MX, X-GHP:  $h_{min} = 60 \text{ mm}$ 

X-C 27 G3 MX, X-GN 27 MX: h<sub>min</sub> = 60 mm

#### Spacing

50-100 cm along the cable tie. Adjust spacing as needed to achieve stability of cable tie

#### Corrosion information

 These zinc-coated fasteners are not suitable for long-term service outdoors or in otherwise corrosive environments.

Steel

• For more details, please refer to following technical document: Hilti Corrosion Handbook.

#### System recommendation

• For more details, please refer to the chapter **Accessories and consumables compatibility** in the Direct Fastening Technology Manual (DFTM).

#### Service installation information

#### Suitable cables with X-ECT MX, X-ECT 40 MX and X-UCT MX fastener

| Cable type | Cable measure diameter | No. of cables |
|------------|------------------------|---------------|
| NYM 3x1.5  | 8 mm                   | 14            |
| NYM 5x1.5  | 10 mm                  | 10            |

#### Suitable conduits with X-EKS/X-EKSC MX fastener

| Conduit type    | Conduit size | No. of conduits |
|-----------------|--------------|-----------------|
| Plastic conduit | 16-40 mm     | 1               |

# **Applications**

# **Examples**

X-UCT-E MX with cable tie for single pipe

#### Load data

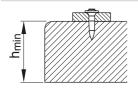

#### **Recommended loads**

| Fastener                                    | Service load <sup>1)</sup> [kN] |
|---|---------------------------------|
| X-UCT-E MX                                  |                                 |
| X-UCT-E MX with 1 White cable tie           | 0.04                            |
| X-UCT-E MX with 1 Blue AND 1 Red cable ties |                                 |
| X-UCT-E MX with EITHER 1 Blue OR 1 Red      | 0.02                            |
| cable tie                                   | 0.02                            |

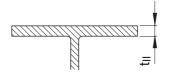

<sup>1)</sup> The recommended service load is determined by the serviceability of the plastic parts.

### **Application requirements**

# Thickness of base material

| Concrete              |                          |
|-----------------------|--------------------------|
| X-U MX, X-U P8,       | h = 90 mm                |
| X-C MX, X-C P8        | h <sub>min</sub> = 80 mm |
| X-GHP MX, X-GN MX,    |                          |
| X-P G3 MX, X-C G3 MX, | h <sub>min</sub> = 60 mm |
| X-P B3 MX, X-C B3 MX  |                          |

| Steel                       |                          |
|-----------------------------|--------------------------|
| X-U 16 MX                   | t > 6.0 mm               |
| X-U 16 P8                   | t <sub>  </sub> ≥ 6.0 mm |
| X-EGN 14 MX<br>X-S 14 B3 MX | t <sub>II</sub> ≥ 4.0 mm |

# Spacing and edge distances

Space fastenings (50 - 100 cm) as needed to control sag and maintain alignment of conduits.

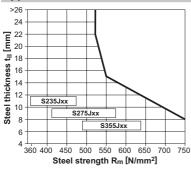

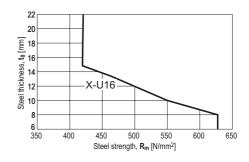

#### **Corrosion information**

These zinc-coated fasteners are not suitable for long-term service outdoors or in otherwise corrosive environments.

For further detailed information on corrosion see relevant chapter in Direct Fastening Principles and Technique section.

For fastening on steel base material

- X-EGN 14 MX
- X-S 14 B3 MX
- X-S 14 G3 MX

#### For fastening on steel base material

• X-U 16 MX

### Fastener selection and system recommendation

#### **Fastener program**

| Designation | Item no. |                    |
|-------------|----------|--------------------|
| X-UCT-E MX  | 2149226  | X-UCT-E MX element |

#### **Tool selection**

| X-U MX, X-C MX:                  | DX 351 MX |
|----------------------------------|-----------|
| X-U P8, X-C P8:                  | DX 351-F8 |
| X-GHP MX, X-GN MX, X-EGN 14 MX : | GX 120-ME |

• See fastener program in the next pages.

#### **Applications**

#### Examples

Cable trunking

Cable trunking

Junction boxes

Conduits & pipes with metal or textile band

# Performance data

Recommended service load

| Designation | Service load |
|-------------|--------------|
| X-ET MX     | 0.1 kN       |

• Recommended service load is determined by the serviceability of the plastic part.

#### **Application recommendation**

#### Base material thickness

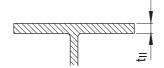

X-U, X-P:  $h_{min} = 80 \text{ mm}$ 

X-P B3 MX:  $h_{min} = 60 \text{ mm}$ X-P G3 MX, X-GHP:  $h_{min} = 60 \text{ mm}$ 

X-C 27 G3 MX, X-GN 27 MX:  $h_{min} = 60 \text{ mm}$ 

Steel

t<sub>II</sub> ≥ 4 mm

#### **Corrosion information**

- These zinc-coated fasteners are not suitable for long-term service outdoors or in otherwise corrosive environments.
- For more details, please refer to following technical document: Hilti Corrosion Handbook.

#### System recommendation

• For more details, please refer to the chapter **Accessories and consumables compatibility** in the Direct Fastening Technology Manual (DFTM).

#### Installation information

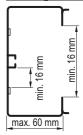

#### Conditions for use

- No fastenings on ribs
- Underside of trunking must be smooth
- X-ET MX only in pre-drilled holes

### Trunking dimensions and properties

• Material thickness:  $t_1 \le 2 \text{ mm}$ 

• Material: PVC

#### Power-actuated tool and fastener recommendation

# X-TT Textile tape

#### **Product info**

#### Product description

- · Quick and cost efficient fastening
- No finishing required
- Several pipes or conduits can be fastened to the floor in parallel
- X-ET fastener can be used for greater stability
- No sound transmission when used to fasten metal pipes

# **Application**

Textile tape for cable and conduit fastening on floors.

#### Base material

Soft Tough concrete

Steel Masonry Solid brick

#### **Environmental conditions**

Dry indoor Floor application

### **Application requirement**

# Minimum pointside penetration depth, under tension load

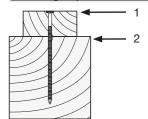

For smooth nail:  $t_{pen} = 8 \times d_n$ For profiled nail:  $t_{pen} = 6 \times d_n$ 

#### Spacing and edge distance

Geometrical limitations, like spacing and edge distance, shall be in compliance with EN 1995-1-1 or other applicable regulations.

#### Fastening quality assurance

#### Fastening inspection for wood to wood connection

- 1 Nail head shall be flush with the wood surface
- 2 Fastened wood member should be fully in contact with the supporting wood member, if not differently required by the specific design of the connection.

#### Installation information

#### Pre-drilling

Pre-drilling requirements are described in EN 1995-1-1, section 8.3.1.2.
